

SMM and the Safety Possibilities with Good Data

*Nancy Rockbrune
Head, Safety Management*

ICAO SMM

Data Sources

- ↗ Mandatory reporting systems
- ↗ Voluntary reporting systems

Data Sources

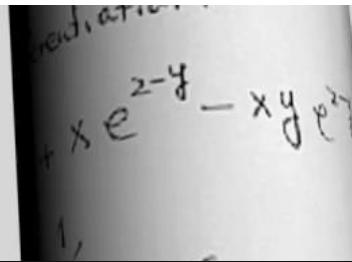

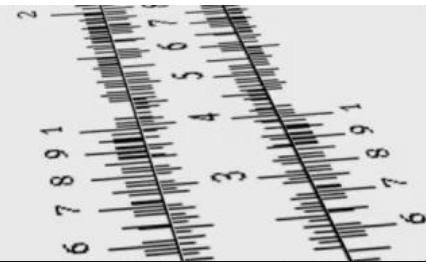

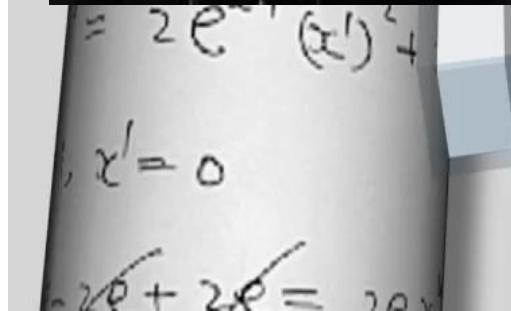

Note 1.— SDCPS refers to processing and reporting systems, safety databases, schemes for exchange of information, and recorded information including but not limited to:

- a) data and information pertaining to accident and incident investigations;*
- b) data and information related to safety investigations by State authorities or aviation service providers;*
- c) mandatory safety reporting systems as indicated in 5.1.2;*
- d) voluntary safety reporting systems as indicated in 5.1.3; and*
- e) self-disclosure reporting systems, including automatic data capture systems, as described in Annex 6, Part I, Chapter 3, as well as manual data capture systems.*

Annex 19, 2nd Ed.

“to measure is to know – if you cannot measure it, you cannot improve it”
– Lord Kelvin

Use of Data

- ↗ Conduct analysis on clean defensible data / information
 - Identify hazards and risks
 - Prioritize risks and subsequent actions to mitigate
 - Measures process performance
 - Identify and prioritize contributing factors to process performance
 - Measure and predict process performance improvements
- ↗ Communicate findings as appropriate

Data Management Principles

- ↗ Managing by averages leads to flawed decision making - not accounting for process variation
- ↗ If measurement system variation is too large there is an increased risk of:
 - Rejecting good data
 - Accepting bad data
- ↗ Important to know how much of the observed variation of a process is due to the actual process itself

Data Management Principles

- ↗ Operational definitions (includes taxonomies) help reduce subjectivity and variance in a measurement system (data)
- ↗ Operational definitions can be:
 - A written statement
 - Templates
 - Display of comparisons (colour chart)
- ↗ Operational definitions should be:
 - Something people can really use
 - Enables different people to reach the same conclusion (repeatability)
 - Enables the same person to reach the same correct conclusion at different times (reproducibility)

Taxonomy / Operational Definitions

- ↗ Controls data inputs
- ↗ Reduce subjectivity
- ↗ Reduce variation
- ↗ Means for integration (internal and external)

5.1.5 Recommendation.— *The safety database should use standardized taxonomy to facilitate safety information sharing and exchange.*

Annex 19, 2nd Ed.

Measuring Safety Performance ~ SPIs

- ↗ Set measureable (SMART) safety objectives
 - Verify safety performance
 - Validate effectiveness of safety risk controls
- ↗ Track performance
- ↗ Compare against targets
- ↗ Achievement of a target consequently represents an improvement in performance

Metrics

- ↗ Typically focused on number of serious accidents / incidents
- ↗ High profile
- ↗ Easy to measure
- ↗ Reactive
 - Does not expose systemic issues or hazards

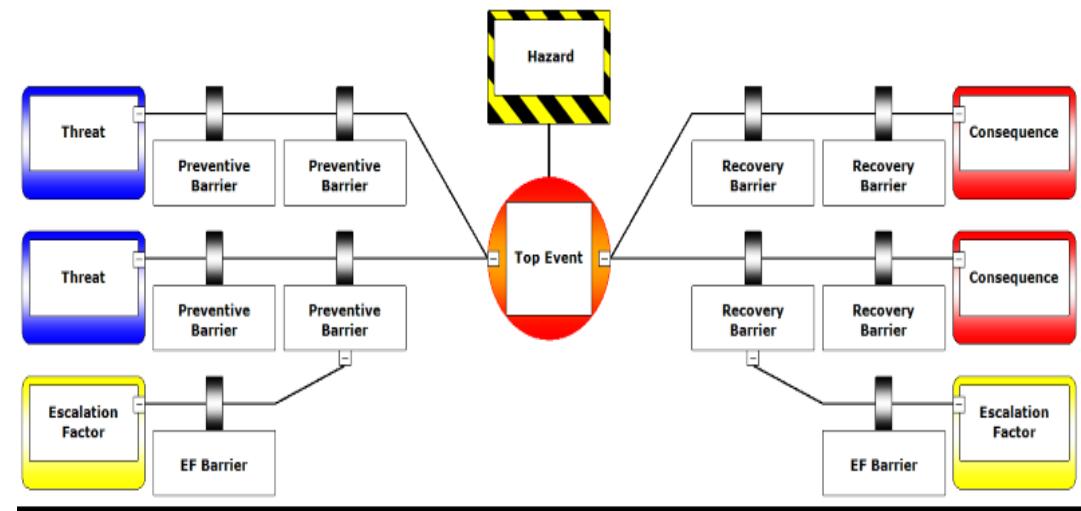

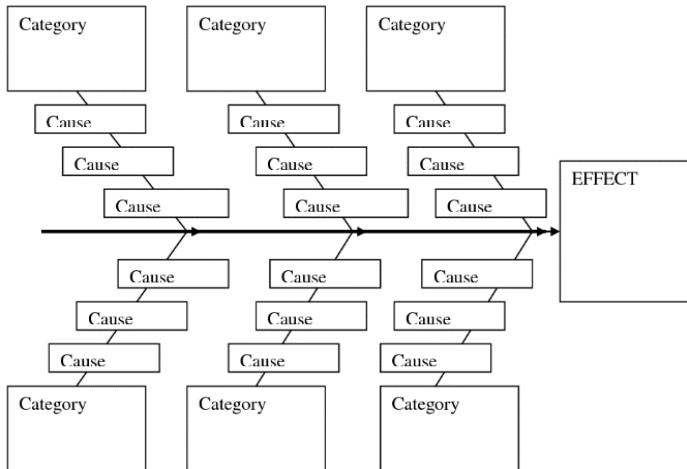

System Approach

- ↗ Managing at the process level is the basis of a “System” approach
- ↗ Considers all processes, their interrelationships and interactions

System Approach

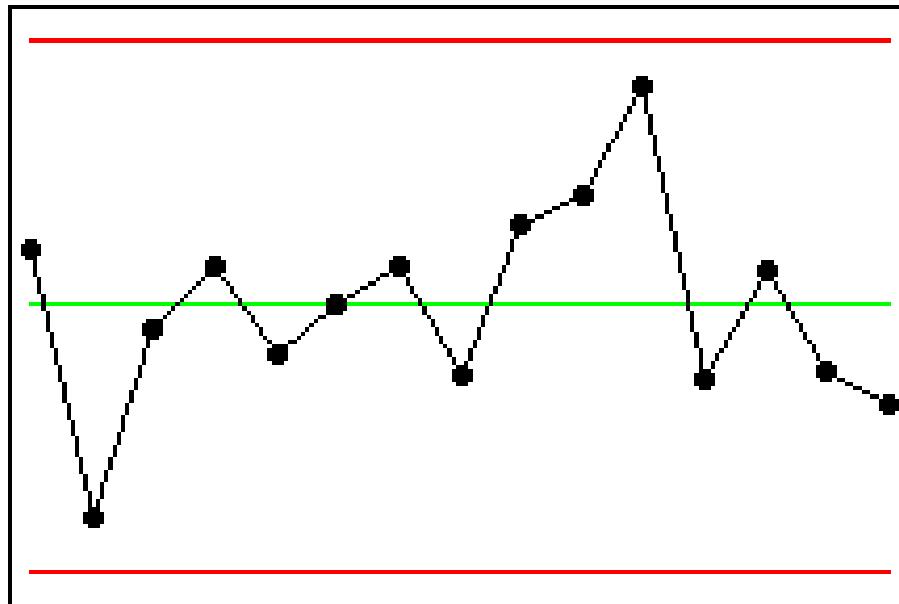

- ↗ Direct relationship between inputs and outputs
- ↗ Therefore to improve the output, changes or improvements to the inputs are required

Control Charts

- ↗ Displays the control of a process
 - In control process shows random variation
 - Out of control process shows unusual variation due to special causes
- ↗ Help to determine where to focus problem-solving efforts by distinguishing between common and special-cause variation

Sample ~ Control Chart

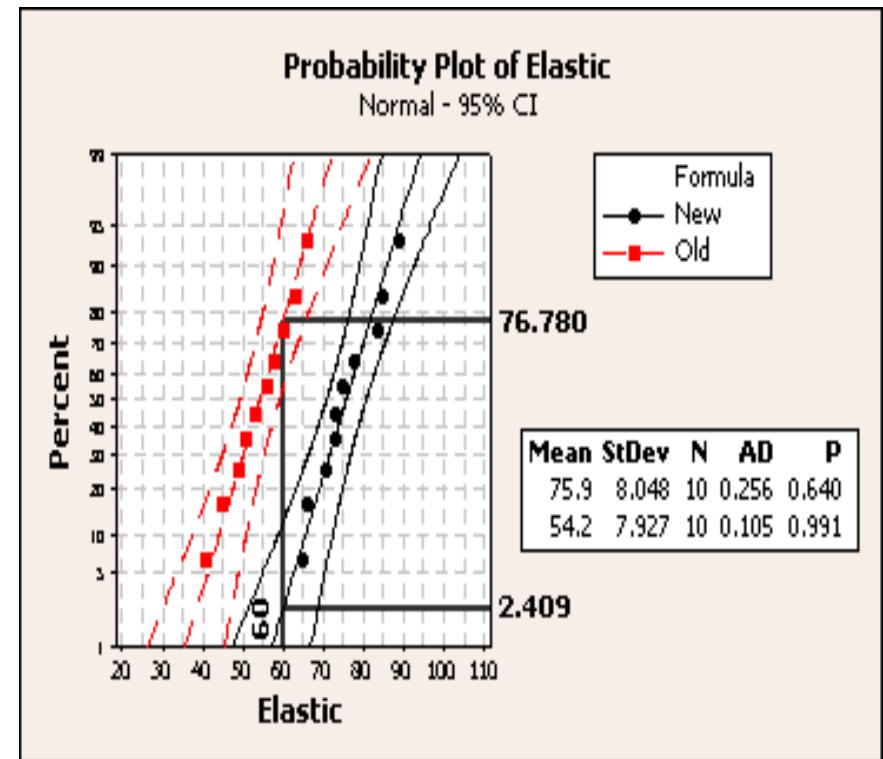

Upper Control Limit (UCL)

Centre Line

Lower Control Limit (LCL)

Sample ~ Probability Chart

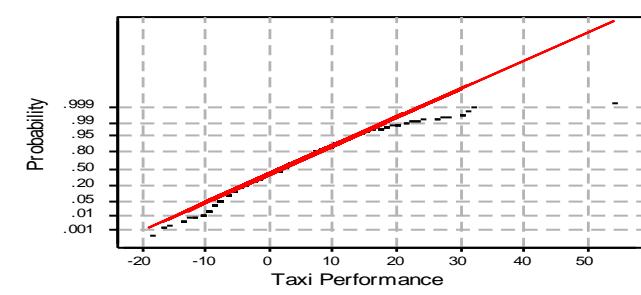

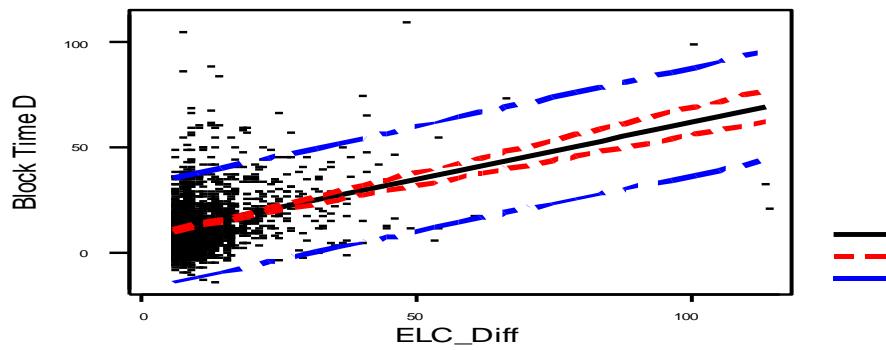

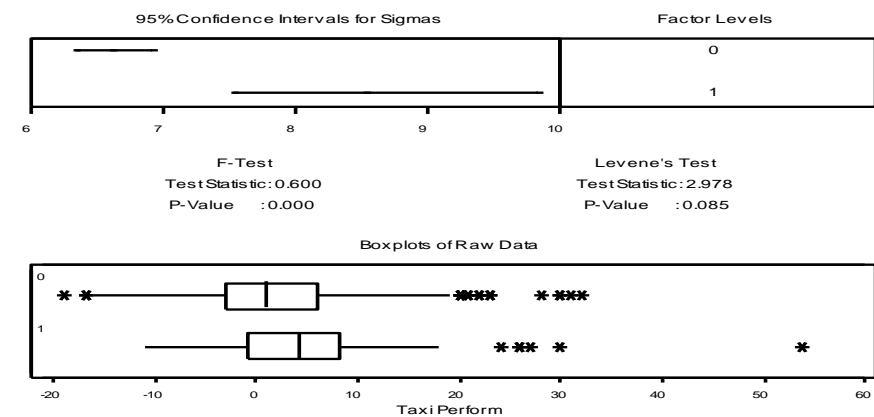

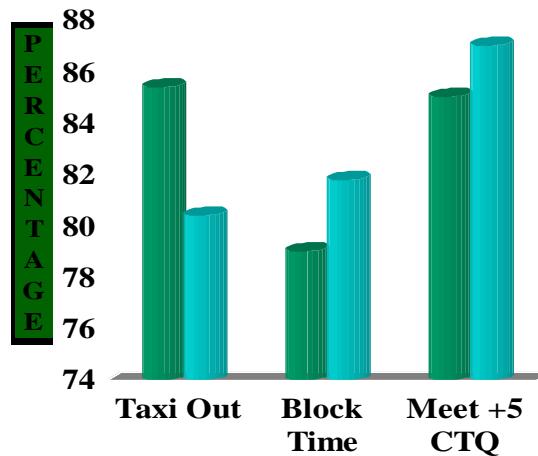

- ↗ Measure process improvements
- ↗ If distributions are normal can estimate the performance if new procedures are put in place

Why is Process Control Important?

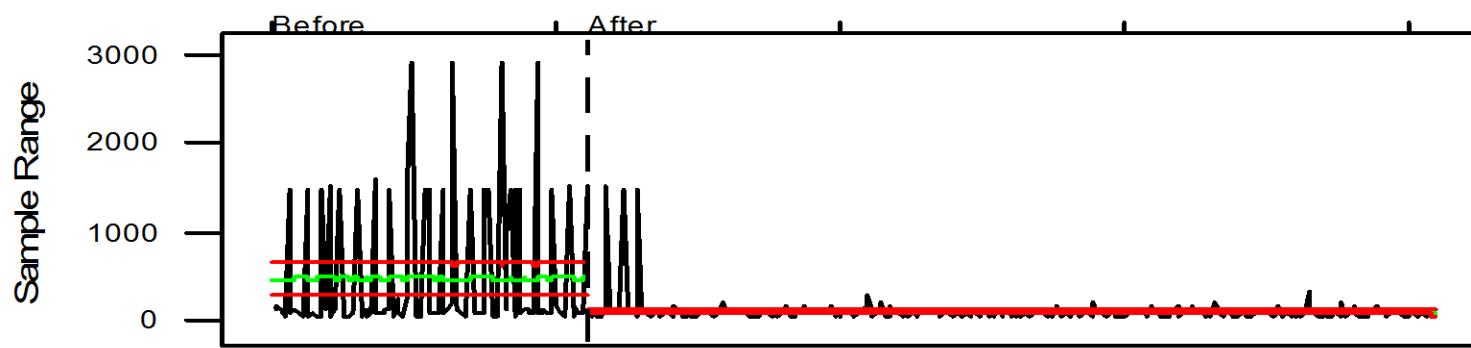

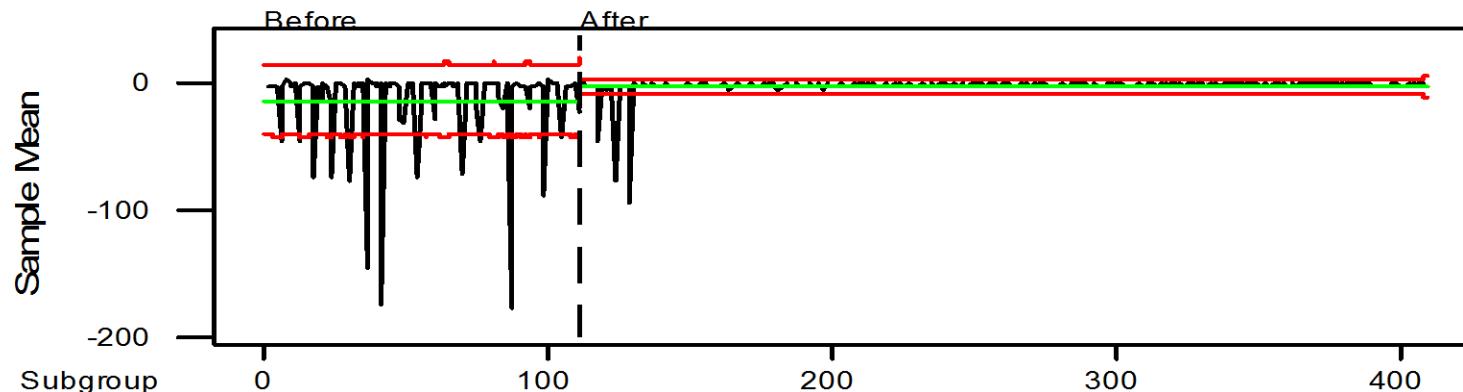

- ↗ Higher quality
- ↗ Increased efficiency
- ↗ Lower costs
- ↗ Fewer errors
- ↗ Leaner organization
- ↗ Sustained profitability
- ↗ Performance goals tied to business priorities
- ↗ Performance competencies ~ tools used to achieve goals

Process Control Example ~ ELC

Process Control ~ Example

Xbar/R Chart for ELC_Diff by B/A

Other Examples

↗ Unstable approach criteria

- Studies being made to evaluate the FSF initiative to reduce the height to 300ft before Go-Arounds
- Data will identify if feasible or not

↗ RNAV vs Visual Approach

- Comparing the approach tracks and monitor how many flights flying visual app vs RNAV results in Go-Arounds
- Airline can then quantify the cost, review their processes

Other Examples

↗ Proactive maintenance

- Data can support airlines engine inspections and avoid costly repairs when too late
- Specific attention given to engine vibrations

↗ Predictive Maintenance

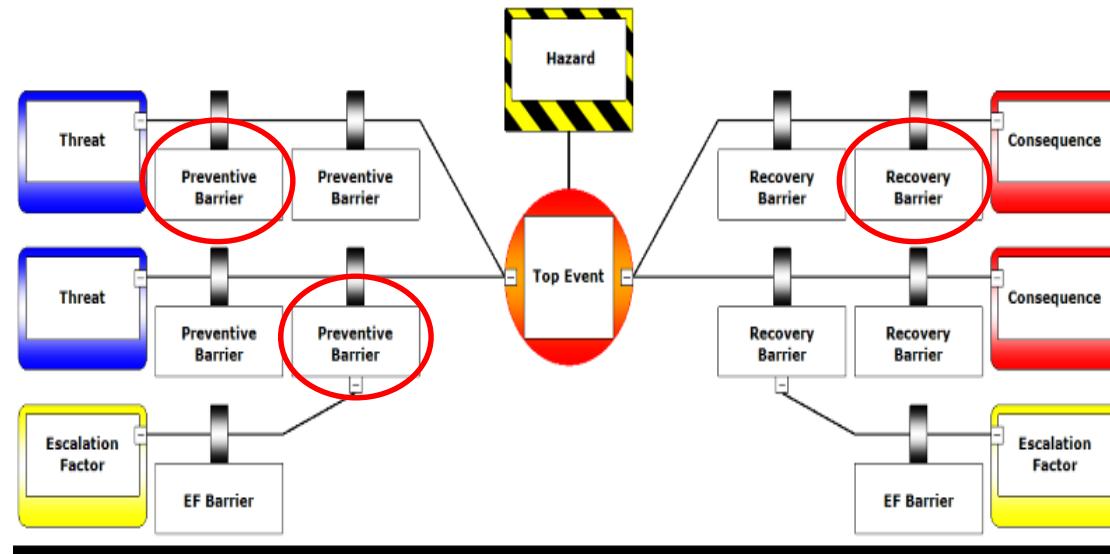

- Use of AI

WHAT DATA AND INFORMATION

Proactive Shift

- ↗ SPIs measure performance of safety controls
 - Preventative
 - Recovery
- ↗ Shift focus to precursors

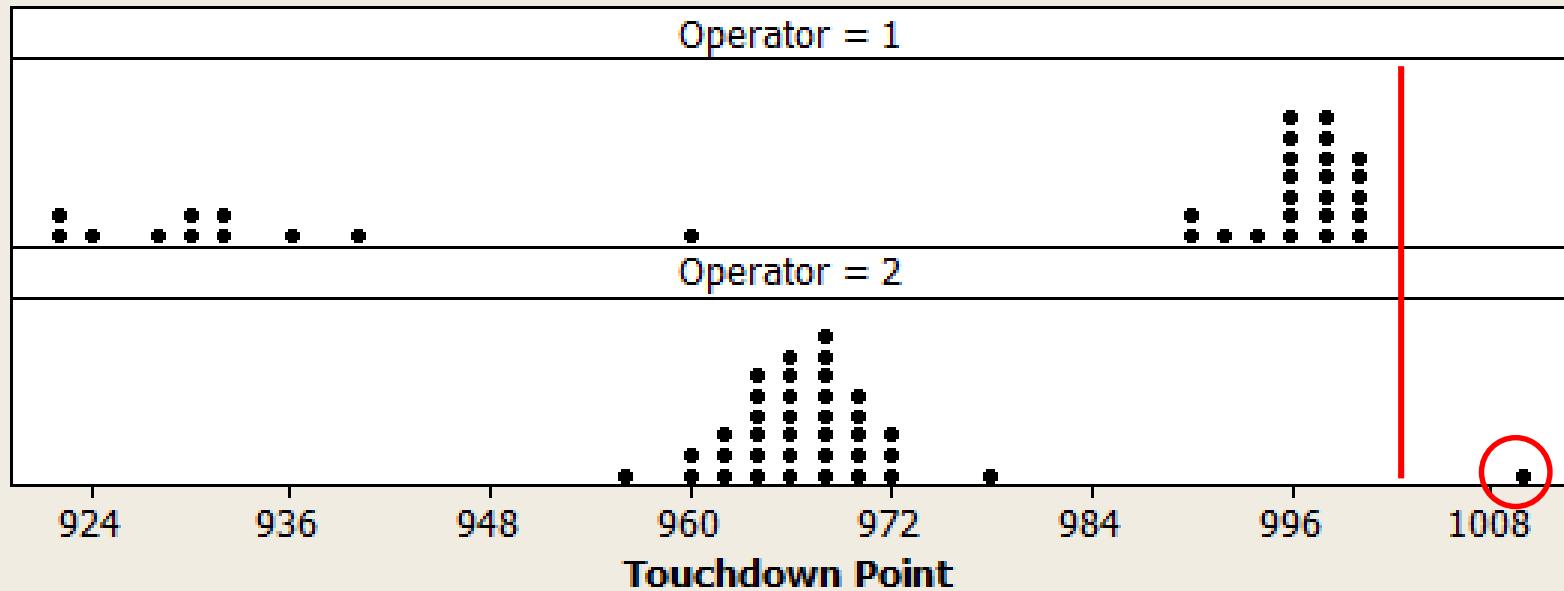

Sample SPI

IATA SPI GROUP: Draft SPI Candidate	
SPI / Safety Objective (SO)	Long Landing
Area of Safety Concern	Organizational
Safety Aim	Zero instances of long landings
Definition(s)	<p>Threshold ~ touchdown >x m from runway threshold</p> <p>Distribution ~ distance from runway threshold at landing</p>
Possible Data/Information Source(s) & (Expected Reliability for Source)	<p>FDM (High)</p> <p>Touchdown point</p> <p>Length of Runway</p>
SPI Data Source(s)	Distance from runway threshold at landing
Reporting Period and Interval	As determined by operator
Output format	As determined by operator
Alert Level	Each operator to determine their own alert level
Safety Performance Target	Each operator to determine their own target
Safety Action Plan(s)	Each operator to determine their own safety action plan.
Notes	Can do comparisons if carriers have same threshold limits

Sample SPI ~ Long Landing

- ↗ Identify touchdown points of ALL flights

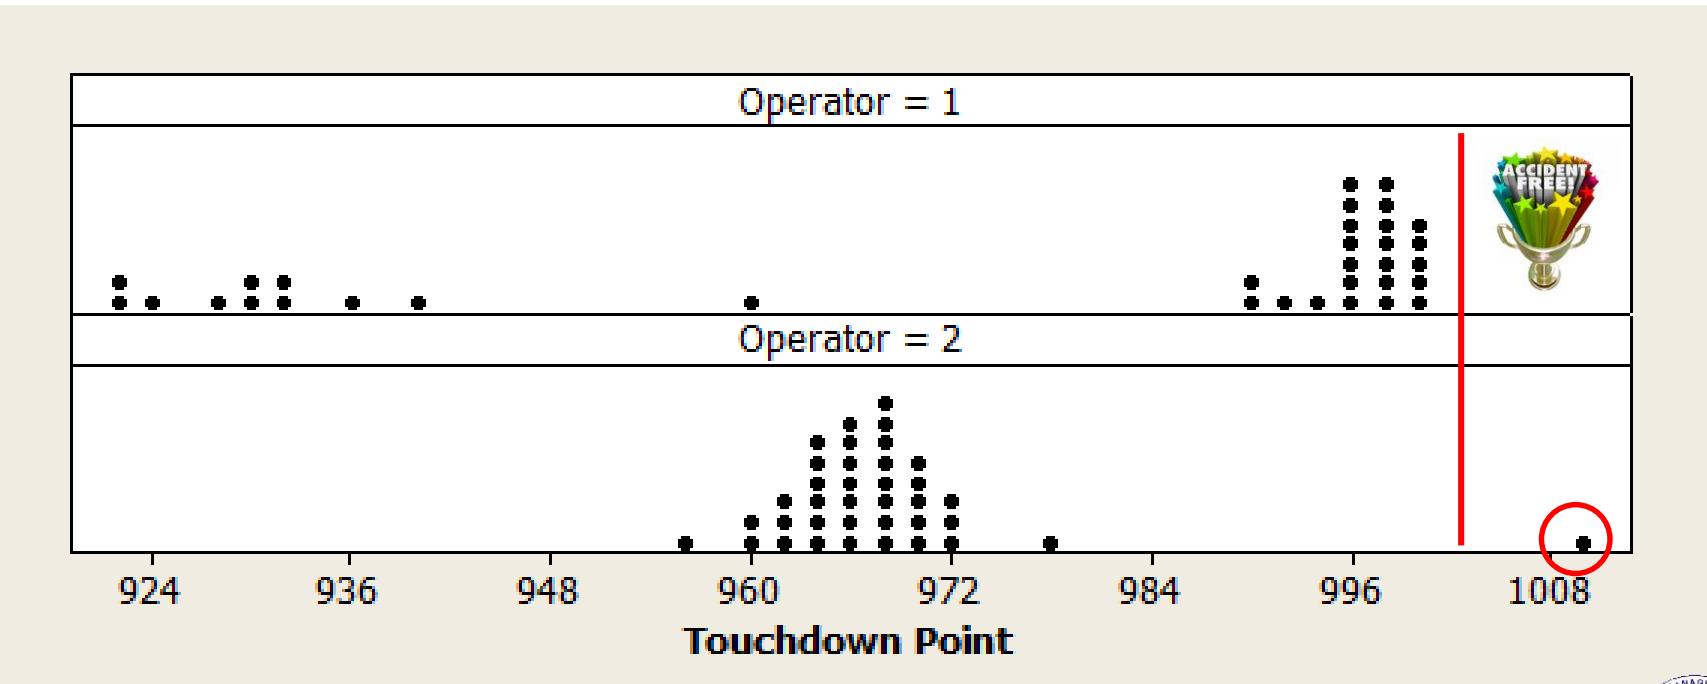

IATA SPI GROUP: Draft SPI Candidate	
SPI / Safety Objective (SO)	Long Landing
Area of Safety Concern	Organisational
Safety Aim	Zero instances of long landings
Definition(s)	Threshold = touchdown > m from runway threshold Distribution = distance from runway threshold at landing
Provide Data/Information	IOM (Flight)
Sources(s) & Expected Reliability for Sources	Touchdown point Length of Runway
SPR Data Inversion	Distance from runway threshold at landing
Reporting Period and Interval	As determined by operator
Output Format	As determined by operator
Alert Level	Each operator to determine their own alert level
Safety Performance Target	Each operator to determine their own target
Safety Action Plan(s)	Each operator to determine their own safety action plan.
Notes	Can do comparisons if carriers have same threshold limits

Example ~ Long Landing

- ↗ Identify touchdown points of ALL flights

IATA SPI GROUP: Draft SPI Candidate	
SPI / Safety Objective (SO)	Long Landing
Area of Safety Concern	Organisational
Safety Aim	Zero instances of long landings
Definition(s)	Threshold = touchdown vs m from runway threshold Distribution = distance from runway threshold at landing
Provide Data/Information	IOM (Flight)
Sources(s) & Expected Reliability for Metrics	Touchdown point Length of Runway
SPR Data Inversion	Distance from runway threshold at landing
Reporting Period and Interval	As determined by operator
Output Format	As determined by operator
Alert Level	Each operator to determine their own alert level
Safety Performance Target	Each operator to determine their own target
Safety Action Plan(s)	Each operator to determine their own safety action plan. Notes: Can do comparisons if carriers have same threshold limits

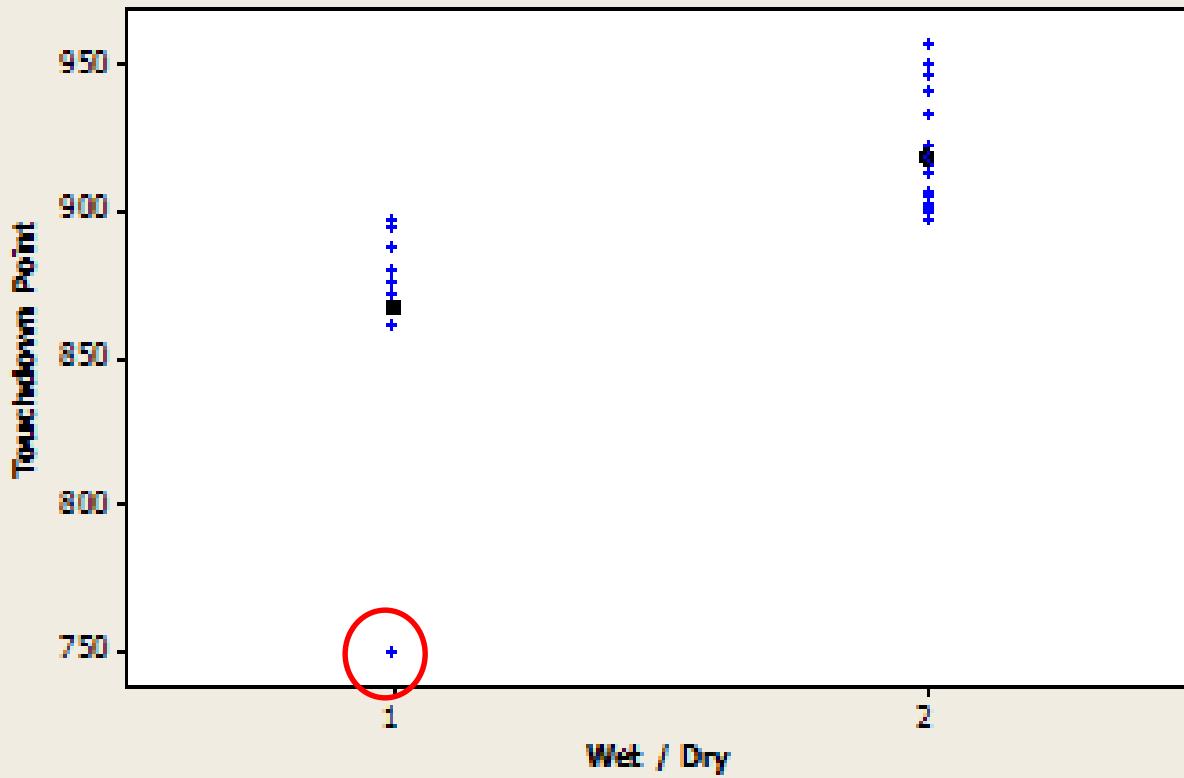

Sample FDM Parameters

SPs	FDM PARAMETERS																				
	Speed over the threshold	Speed on ground	Autopilot disengage	Altitude	AoA	Pitch	Bank angle	G forces	Flap settings	Landing gear	Spoiler position	Aircraft weight	Center of gravity	Touch-down point	Breaking action	General landing configuration (flap/gear/altimeter etc. settings)	Glidepath deviation (horizontal-altitude / vertical-azimuth)	Course deviation/correction	Proximity to another aircraft	EGT (exhaust gas temperature) or RPM	Application of reverse thrust
Long Landing	X			X		X			X			X	X	X		X					
Runway End Zone Ground Speed	X	X	X	X		X			X			X	X	X	X						X
Runway Turn-Off Speed		X									X							X			X
Sink Rate Before Touch Down	X				X	X			X			X	X	X							
Tail Clearance at Take-Off		X				X			X			X	X	X							
Tail Clearance on Landing	X			X	X	X			X			X	X	X							
Bank Angle During Landing			X			X						X						X			
EGPWS ~ Pull-Up	X			X							X	X	X					X			
Rejected Take Off (RTO)		X									X	X	X		X				X	X	X
a. Environmental Risk																					
b. Runway Side Excursion																					
c. Runway Over-Run																					
Taxi Speed Exceedance	X	X										X	X	X	X	X				X	X
TCAS RA			X	X	X													X	X	X	X
Unstable Approach Continued	X			X	X	X	X	X	X	X	X	X	X	X			X	X	X	X	
Height that Stabilization Achieved	As above																				
Proximity to Alpha Max	X				X	X	X	X	X	X	X	X	X	X				X			
Unusual Attitude ~ Pitch					X				X												
Unusual Attitude ~ Bank Angle						X												X			
In-Flight Shut-Down (IFSD)							X													X	
Landing Below Final Reserve Fuel																					

Sample SPI ~ Long Landing

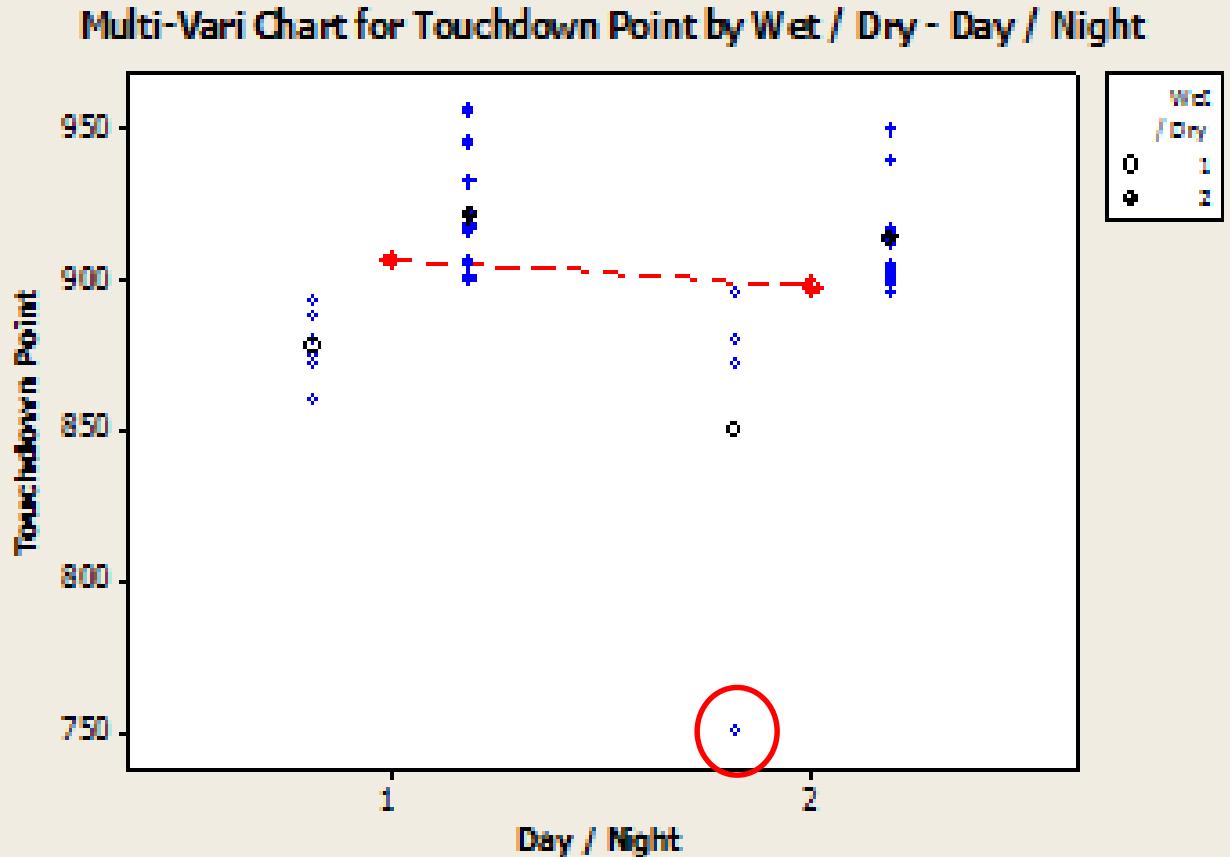

Multi-Vari Chart for Touchdown Point by Wet / Dry

IATA SPI GROUP: Draft SPI Candidate	
SPI / Safety Objective (SO)	Long Landing
Area of Safety Concern	Organisational
Safety Aim	Zero instances of long landings
Definition(s)	Threshold = touchdown vs m from runway threshold Distribution = distance from runway threshold at landing
Provide Data/Information	FOM (Flight)
Sources & Expected Reliability for Sources	Touchdown point Length of Runway
SPM Data Inversion	Distance from runway threshold at landing
Reporting Period and Interval	As determined by operator
Output Format	As determined by operator
Alert Level	Each operator to determine their own alert level
Safety Performance Target	Each operator to determine their own target
Safety Action Plan(s)	Each operator to determine their own safety action plan. Notes: Can do comparisons if carriers have same threshold limits

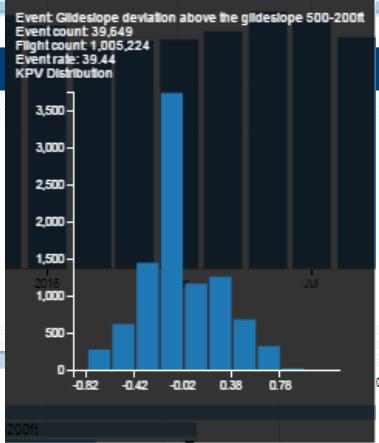

This multi-vari chart shows condition of runway surface is a contributing factor

Sample SPI ~ Long Landing

Outlier (750') at night
with a wet runway
surface ~ only 1
instance

IATA SPI GROUP: Draft SPI Candidate	
SPI / Safety Objective (SO)	Long Landing
Area of Safety Concern	Organisational
Safety Aim	Zero instances of long landings
Definition(s)	Threshold = touchdown vs m from runway threshold Distribution = distance from runway threshold at landing
Provide Data/Information	FOM (Flight)
Source(s) & Expected Reliability for Metrics	Touchdown point Length of Runway
SP Data Interval	Distance from runway threshold at landing
Reporting Period and Interval	As determined by operator
Output Format	As determined by operator
Alert Level	Each operator to determine their own alert level
Safety Performance Target	Each operator to determine their own target
Safety Action Plan(s)	Each operator to determine their own safety action plan. Notes: Can do comparisons if carriers have same threshold limits

Rate of descent high 3000-2000ft
 Glideslope deviation below the glideslope 500-200ft
 Rate of descent high 2000-1000ft
 Glideslope deviation above the glideslope 500-200ft
 Tailwind high during landing
 Rate of descent high 1000-500ft
 Heading variation 500-50ft
 Acceleration (normal) high at touchdown (hard landing)
 Glideslope deviation below the glideslope 1000-500ft
 Glideslope deviation above the glideslope 1000-500ft
 Go-around
 Localizer deviation 1000-500ft
 Roll cycling exceeding 5 deg during final approach
 Localizer deviation 1500-1000ft
 Localizer deviation 500-200ft
 Flap movement late during approach
 Landing gear late retraction during go-around
 Glideslope deviation above the glideslope 1500-1000ft
 Glideslope deviation below the glideslope 1500-1000ft
 TAWS glideslope 500-200ft
 Pitch cycling during final approach
 TAWS glideslope 1000-500ft
 Landing gear late extension
 TAWS glideslope 1500-1000ft
 Speedbrake deployed during final approach
 Speedbrake deployed during go-around
 Roll cycling exceeding 15 deg during final approach

Safety Information Exchange Program

Background

- ↗ States must manage the safety performance of its aviation system
 - Requires safety management inputs by both the State and Service Providers
- ↗ States have recognized the value of using this aggregated, de-identified Operator information to support State safety activities
 - All safety data and safety information deemed relevant by a State is in scope for a IATA Safety Information Exchange Program

IATA Program

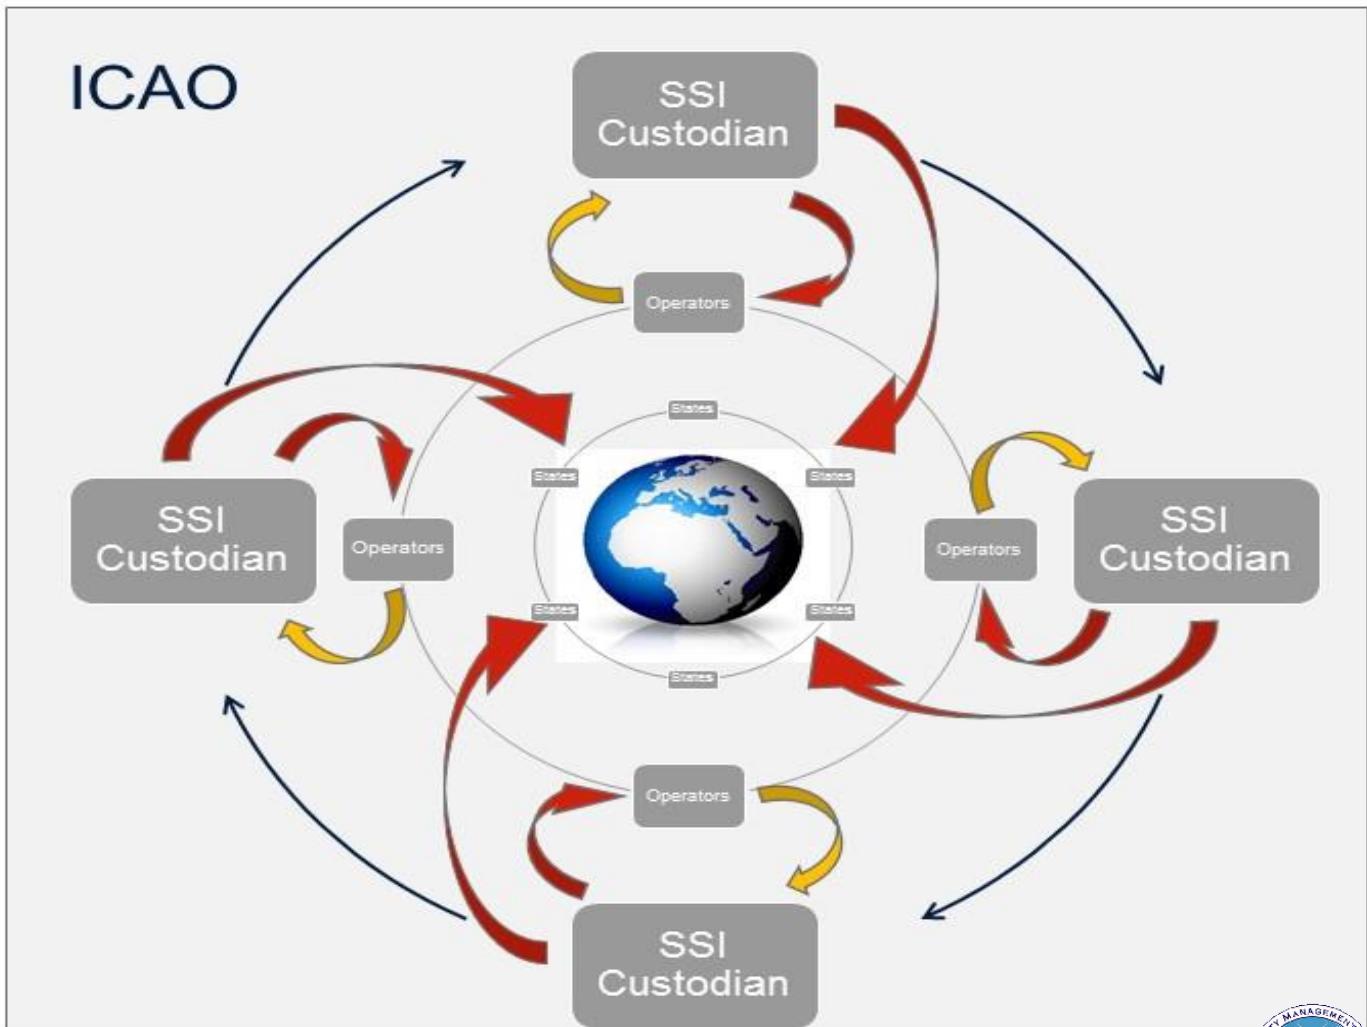

- ↗ Industry / State collaboration to develop Safety Information Exchange and Analysis
 - ICAO Assembly A39-WP/117
- ↗ Models would:
 - Meet the needs of an SSP to manage safety at the State level
 - Address Industry concerns
 - Adhere to Annex 19 protection principles
 - Streamline global safety-sharing channels and harmonize metrics

Collaborative Approach to SM

↗ IATA Safety Information Exchange Program

- Enables States access to de-identified aggregate Safety information collected by IATA
- Supports both State and Regional Safety Oversight Organization (RSOOs) Safety Management activities
- Also supports the ICAO Global Aviation Safety Plan (GASP) objectives and the work of the Regional Aviation Safety Groups (RASGs)

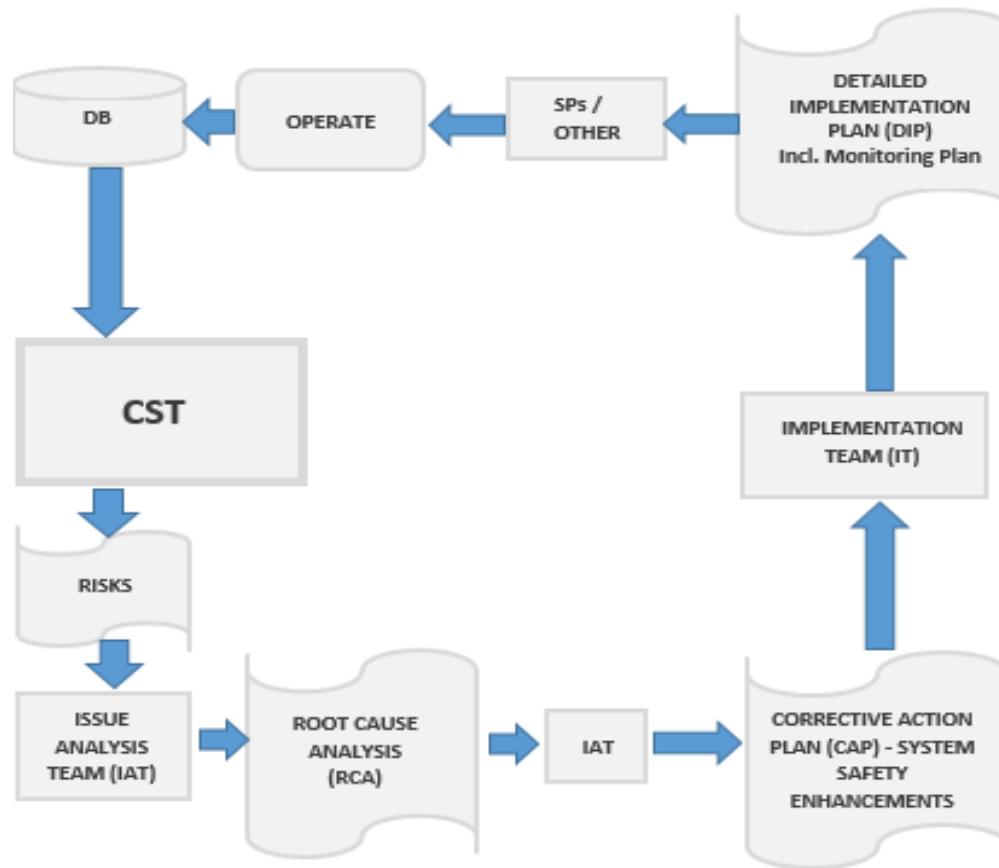

Safety Information Exchange Model

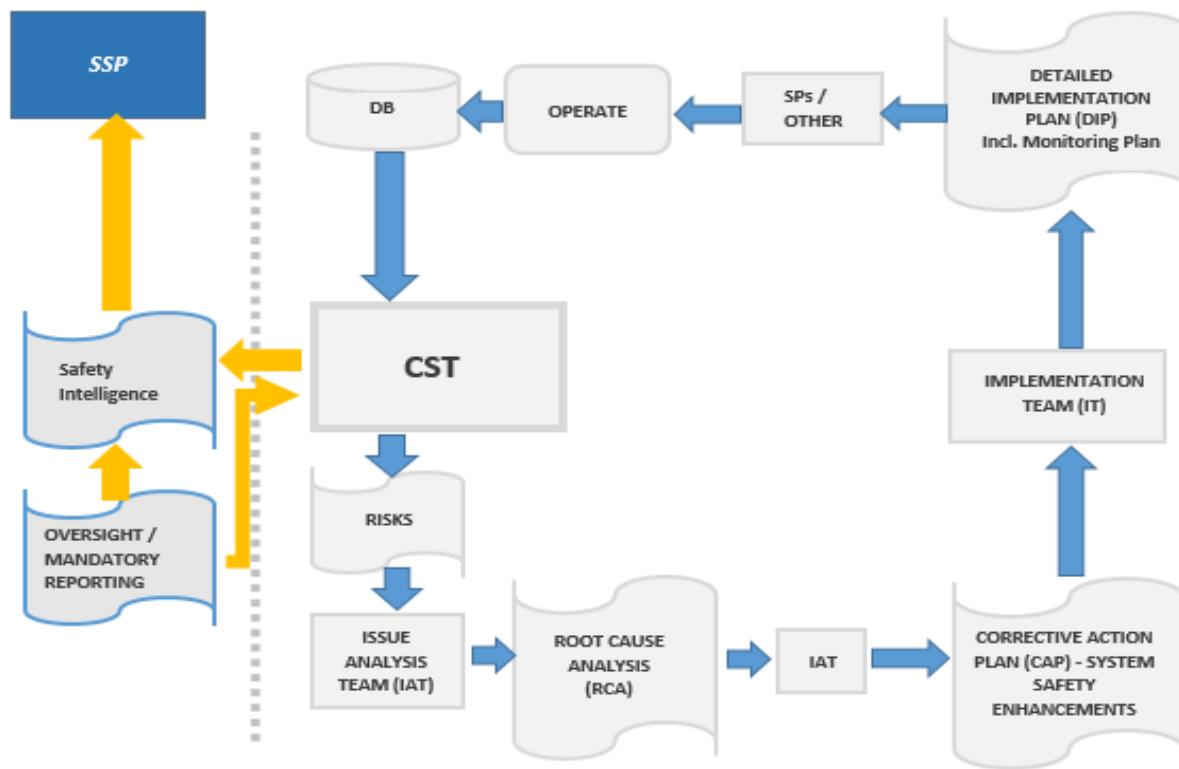

Collaborative Approach to SM

- ↗ Establishment of a “Collaborative Safety Team”
 - Mechanism for safety information sharing and exchange to identify top safety risks, and develop mitigation strategies to improve the safety performance of the respective State aviation system
 - Team includes representation from the State and aviation system Service Providers
 - Team establishes the protocols for the Safety Information Exchange (SIE)
 - Frequency of the meeting based on the need and desire of the State and participating Service Providers

Collaborative Safety Team (CST)

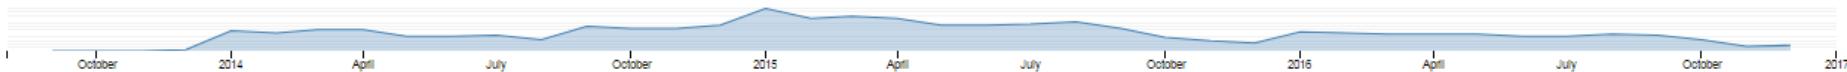

CST ~ SSP Interface

Event rate by month

In-Depth Studies

How has FDX been used?

Support to Airspace Optimization work

- ↗ IATA has been working with region's ANSPs on optimizing routings and separation requirements amongst FIRs
- ↗ FDX TCAS data is being used in order to avoid airspace redesign efforts that conflict with known safety risks
- ↗ Key point: aggregate data is supporting alignment between operations and safety efforts

Other Programs

Data4Safety

Partnership for Data Driven Aviation Safety Analysis

Supported by EASA

Data used solely for advancement of safety

Non-punitive reporting

A collaborative approach

Balancing interests of all participants

“The programme aims at collecting and gathering all data that may support the management of safety risks at European level.”

IOSA SMS Strategy

IOSA SMS Audit Results

- ↗ SMS designated SARPs introduced in 2010
- ↗ Over 330 audits since
- ↗ Significant implementation ~ much yet to be done

IOSA SMS Strategy

- ↗ IOSA reflects ICAO SMS framework
 - As standards and recommended practices
- ↗ SMS designated SARPS remained primarily untouched
- ↗ IOSA ideal mechanism to advance SMS implementation
- ↗ Strategy elevated all IOSA SMS designated provisions to standards by 2016

Challenges

Keep it Simple

- ↗ Can get caught up in all of the data and information gathered
- ↗ Need to focus on the problems not the solution

Thank you!
