

**HANDBOOK
ON THE
INTERNATIONAL AIRWAYS
VOLCANO WATCH (IAVW)**

**OPERATIONAL PROCEDURES
AND CONTACT LIST**

SECOND EDITION — 2004

*Approved by the Secretary General
and published under his authority*

INTERNATIONAL CIVIL AVIATION ORGANIZATION

DOCUMENT CHANGE RECORD

Parts 1 to 4

DATE	SECTION/PAGES AFFECTED	
16.8.16	Part 2	Updates to VAAC Toulouse MWO location names
	Part 4	Table 4-2, VAAC Tokyo e-mail address
27.1.16	Part 2	Updates to VAACs London and Toulouse MWO location names and location indicators
30.6.15	Part 2	Update of description of London VAAC area of responsibility and updates to VAACs Anchorage, London, Montreal, Tokyo, Toulouse and Washington MWO and ACC/FIC location names and location indicators
	Part 4	Table 4-2, VAAC Wellington contact numbers Table 4-3, VAAC Buenos Aires back-up VAAC and VAG bulletin headers
26.11.14	Part 4	Amendment to paragraph 4.6.1 h) and deletion of Notes 1 and 3
	Appendix C	Amendment to existing text and insertion of new text
21.11.14	T of C	Addition of new sections in Part 4, Table 4-4 and Appendix G, update of page numbers
	Part 2	Changes to descriptions of areas of responsibility and updates to VAAC Tokyo MWO and ACC/FIC location names and location indicators
	Part 3	Update of link to Canadian Meteorological Centre
	Part 4	Update of phases of eruption in Section 4.1, new Sections 4.7 and 4.10, and change to Table 4-3 (IAVWOPSG/8 report refers) New Section 4.2 Amendments to Section 4.3 corresponding to new Table 4-4 Corrections to contact information in paragraphs 4.6.1 and 4.6.3 Editorial improvements to paragraph 4.6.1 Table 4-2, VAAC Buenos Aires and VAAC Montreal contact numbers Table 4-3, VAAC London back-up VAAC VAA and VAG bulletin headers New Table 4-4
	Appendix A	Editorial amendments (references)
	Appendix E	Amendments to lines 3, 7, 11 and 16 and minor editorial amendments
	Appendix G	New appendix

DATE	SECTION/PAGES AFFECTED	
7.8.13	T of C	Addition of Part 4, Appendix F
	Part 2	Change of notation used for latitude and longitude to degrees and minutes and update of corresponding map
	Part 4	Correction to page 4-2 ("ISCS" replaced with "WIFS"), page 4-5 (numbering of sections of the NOTAM amended), insertion of new section 4.8
	Appendix C	Corrections (grammatical) to paragraph 1
	Appendix F	New appendix (Appendix G of IAVWOPSG/7 report refers)
6.11.12	Part 2	Addition of MWOs/ACCs to Tokyo and Toulouse VAACs
25.8.12	Part 3	Correction of website URLs for VAACs Anchorage and Tokyo
17.8.12	Part 2	Rewording of the coordinates for the Toulouse area of responsibility Changes to names and location indicators of aerodromes under Toulouse area of responsibility
	Part 4	Table 4-2, VAAC Washington contact numbers Table 4-3, VAAC Wellington VAA and VAG bulletin headers
21.6.12	Part 4	Update to Table 4-2, VAAC contact numbers – Buenos Aires VAAC
5.6.12	Part 4 and Appendix A	Deletion of references to Vienna International OPMET Data Bank
	Appendix B	Change to title of Appendix B Updating of AFTN addresses for MID and AFI regions
17.2.12	Part 2	Change to Anchorage, Darwin, Washington and Wellington VAAC areas of responsibility and update of corresponding map
	Part 3	Update of VAAC Buenos Aires website URLs (English and Spanish)
	Part 4	Amendment of Sections 4.1, 4.2 and 4.5 Replacement of Section 4.7 (Appendix F of IAVWOPSG/5 report refers.) Table 4-2, update of administrative e-mail for VAAC Anchorage and website URLs for VAAC Buenos Aires (English and Spanish) Table 4-3, update of Tokyo VAG and Wellington VAA bulletin headers
	Appendix C	Miscellaneous amendments
7.10.11	Part 4	Update page 4-13, para 4.7.4, changed para ref. no. 4.6.2 to 4.7.3.
31.8.11	Part 4	Update to Table 4-3, VAA bulletin header
16.8.11	Part 4	Update to Table 4-2, VAAC contact numbers – Anchorage VAAC

DATE	SECTION/PAGES AFFECTED	
8.2.11	Part 4	Update to Table 4-2, VAAC contact numbers – Wellington VAAC
9.12.10	Part 4	Updated page 4-7 added para 4.3.4; page 4.9, para 4.5.1, line 1, added “ <i>volcano observatory</i> ” after “ <i>WMO</i> ”; para 4.5.1 a) added footnote no. 5; para 4.5.1 c) line 3, added “ <i>using the PNG format</i> ” after “ <i>graphical format</i> ” and deleted “ <i>(in a position to do so)</i> ”; page 4-10, added “ <i>see Appendix E – VONA</i> ”; page 4-17, Table 4-2. updated VAAC Buenos Aires URL.
25.8.10	Part 4	Updated page 4-7, para 4.3.3 changed the word “ ASHTAM” to “NOTAM” and “airport” to “aerodrome”.
12.7.10	Part 2	Updated Wellington (New Zealand) area of responsibility text Replaced VAAC Map
	Part 4	New paragraph 4.3.3
8.7.10	Part 4	Replaced Appendix E with updated version Appendix F (new) added
14.5.10	Part 2	Change to Toulouse VAAC area of responsibility
14.4.10	Part 4	VAAC Tokyo
26.11.09	Part 3	Amendment to the URL address for New Zealand VAAC
25.9.09	Part 3	Amendment to the URL address for Buenos Aires VAAC
	Part 4	URL address for the eruption source parameters for volcanoes of the world, and introduction of information regarding the availability of ESP
29.5.09	Part 4	Guidance regarding the transmission of information to aviation by selected State observatories Update regarding the distribution (addresses) of ASHTAM/NOTAM for VA.
14.5.09	Part 4	Introduction of new heading “4.7 Action to be taken by pilots in the event of entry into a SO ₂ cloud” and “Table A4-3 — Volcanic ash advisory bulletin headers”
12.3.09	Part 4	Update to Table 4-2, VAAC contact numbers
25.2.09	Parts 3 and 4	Amendment to the URL for Toulouse VAAC
	Part 4	Introduction of new sub-paragraphs 4.5.1 h) recommended practice for “gradual” advisory cessation and 4.6 on standard format of the VA advisories and VA SIGMET used for test purposes
15.12.08	Parts 3 and 4	New web page for VAAC Montreal
24.11.08	Part 4	Pages 4-12 and 14, update of VAAC Buenos Aires AFTN address

DATE	SECTION/PAGES AFFECTED	
19.11.08	Part 2	Page 2-10, Wellington
	Part 4	Page 4-13, Indonesia
22.5.07	Part 4	Buenos Aires
5.11.07	Part 4	Buenos Aires
6.8.07	Part 2 Part 4	Introduction of changes resulting from the IAVWOPSG/3 Meeting Appendices
30.7.07	Part 4	Update of AFTN addresses to be used for sending air-reports, SIGMETs and volcanic ash advisories to London WAFC and SADIS
16.6.07	Part 4	Updated volcano level of alert colour code
14.11.06	Part 4	Introduction of relevant aspects of the Hyogo framework
9.6.06	Part 2	Editorials
	Part 3	Update of VAAC Tokyo homepage
	Part 4	Editorials
2.5.06	Part 4	VAAC Tokyo
24.4.06	Part 2	New format — Inclusion of location indicators for MWOs and ACCs
	Part 4	Deletion of WMO abbreviated headers for ASHTAM and NOTAMs, introduction of Appendix C on back-up procedures and update to VAACs London and Wellington
31.1.06	Part 2	VAACs areas of responsibility
28.11.05	Part 5	Ecuador , Panama
1.11.05	Part 5	Argentina, Chile, Paraguay
30.6.05	Part 5	El Salvador
25.4.05	Part 4	VAAC Buenos Aires
	Part 5	Peru
24.2.05	Part 5	Introduction of Appendix A — Sample letter of Agreement between the ATS, MET authorities and vulcanological authorities and procedures on the transmission of information related to aircraft encounters with volcanic ash (former Appendix A renumbered as B)
29.10.04	Part 4	Introduction of Appendix A on operational procedures for the coordination and transfer of responsibility between VAACs for volcanic ash events

DATE	SECTION/PAGES AFFECTED	
25.10.04	Part 4	AFTN address for ASHTAM/NOTAM
14.9.04	Part 3	VAAC Montreal
1.9.04	Part 2	VAAC Toulouse
16.8.04	Part 2	VAACs Anchorage, London and Toulouse
29.7.04	Part 2	VAACs Buenos Aires, Tokyo and Washington
	Part 3	3.3
	Part 5	Canada, Russian Federation
19.4.04	Parts 3 and 4 VAACs London and Tokyo	
3.3.04	Part 2	VAAC Toulouse
	Part 5	Argentina
22.1.04	Parts 3 and 4 VAAC Tokyo	

TABLE OF CONTENTS

	<i>Page</i>
Part 1. Volcanoes active during the last 10 000 years	1-1
Part 2. Volcanic ash advisory centres (VAACs) designated by ICAO and their responsibilities.....	2-1
Part 3. Useful web sites	3-1
3.1 Volcanic ash advisory centres	3-1
3.2 Worldwide weekly volcanic activity reports	3-1
3.3 Other sites.....	3-2
Part 4. International Airways Volcano Watch — Operational procedures for the dissemination of information on volcanic eruptions and associated volcanic ash clouds in areas which could affect routes used by international flights, and necessary arrangements prior to a volcanic eruption.....	4-1
4.1 Procedures prior to a volcanic eruption	4-1
4.2 Action to be taken by the State volcano observatory in the event of a volcanic eruption	4-2
4.3 Action to be taken by the ACC in the event of a volcanic eruption.....	4-4
4.4 Action to be taken by the NOF in the event of a volcanic eruption.....	4-5
4.5 Action to be taken by the MWO in the event of a volcanic eruption.....	4-6
4.6 Action to be taken by VAACs in the event of a volcanic eruption.....	4-8
4.7 Action to be taken by operators in the event of a volcanic eruption.....	4-11
4.8 Action to be taken by VAACs or MWOs regarding volcanic ash test procedures	4-11
4.9 Guidance to pilots on the detection of sulphurous gases on the flight deck	4-11
4.10 Collaborative decision analysis and forecasting guidelines and procedures between VAACs for volcanic ash advisories	4-12
4.11 Guidance for conducting volcanic ash exercises in ICAO regions.....	4-14
Table 4-1. Addresses for NOFs to use to send ASHTAMs or NOTAMs on volcanic activity to their associated VAAC.....	4-14
Table 4-2. VAAC contact numbers.....	4-17
Table 4-3. Volcanic ash advisory bulletin headers.....	4-20
Table 4-4. Volcano level of alert colour codes for aviation	4-22
Appendix A — Sample letter of agreement between the air traffic services, meteorological authorities and vulcanological authorities	4A-1
Appendix B — AFTN addresses to be used to promulgate special air reports, SIGMETs and volcanic ash advisories to London WAFC and SADIS via appropriate gateway.....	4B-1
Appendix C — Operational procedures for the coordination and transfer of responsibility between VAACs for volcanic ash events	4C-1
Appendix D — Back-up procedures for VAACs.....	4D-1
Appendix E — Volcano observatory notice for aviation (VONA) format	4E-1
Appendix F — Guidance for conducting volcanic ash exercises in ICAO regions	4F-1
Appendix G — Cost recovery for issuance of VONA.....	4G-1
Part 5. International airways volcano watch contact list	5-1
5.1 Alphabetical listing.....	5-1
5.2 List of States by ICAO Region.....	5-2

Part 1

VOLCANOES ACTIVE DURING THE LAST 10 000 YEARS

Volcanoes with Eruptions During the Last 10,000 Years
Prepared in 1995 by Roland Pool, Smithsonian Institution,
Global Volcanism Program, NHB MRC 119, Washington, DC 20560

VOLCANOES OF THE WORLD
3000 0 3000 Km
Mercator Projection

A 101x147 cm map, This Dynamic Planet, showing these volcanoes, earthquake epicenters, impact craters, plus tectonic and physiographic data is available from: US Geological Survey, Map Distribution Center, Box 25256, Federal Center, Denver, CO 800225 (800) USA-MAPS

Part 2

VOLCANIC ASH ADVISORY CENTRES (VAACs) DESIGNATED BY ICAO AND THEIR RESPONSIBILITIES

(Note.— VAACs maintain a 24-hour watch)

EXPLANATION OF THE TABLE

Column

1. Location of the volcanic ash advisory centre (VAAC).
2. ICAO location indicator of VAAC (for use in the WMO header of advisory bulletin).
3. Area of responsibility for the preparation of advisory information on volcanic ash by the VAAC in Column 1.
4. MWOs to which the advisory information on volcanic ash should be sent.
5. ICAO location indicator of the MWOs in Column 4.
6. ACCs/FICs to which the advisory information on volcanic ash should be sent.
7. ICAO location indicator of the ACCs/FICs in Column 6.

Volcanic ash advisory centre	ICAO loc. ind.	Area of responsibility	MWOs to which advisory information is to be sent		ACCs to which advisory information is to be sent	
			Name	ICAO loc. ind.	Name	ICAO loc. ind.

Part 4

INTERNATIONAL AIRWAYS VOLCANO WATCH

OPERATIONAL PROCEDURES FOR THE DISSEMINATION OF INFORMATION ON VOLCANIC ERUPTIONS AND ASSOCIATED VOLCANIC ASH CLOUDS IN AREAS WHICH COULD AFFECT ROUTES USED BY INTERNATIONAL FLIGHTS, AND NECESSARY ARRANGEMENTS PRIOR TO A VOLCANIC ERUPTION

4.1. PROCEDURES PRIOR TO A VOLCANIC ERUPTION

4.1.1 In order to permit efficient application of the measures noted in 4.2 to 4.8, States responsible for flight information regions (FIRs) in which there are active or potentially active volcanoes in proximity to routes used by international flights should make arrangements to ensure that:

- a) active or potentially active volcanoes are instrumentally and visually monitored (e.g. by seismological means supplemented by other information available) by designated volcano observatories supported by appropriate authorities, resourcing and quality management systems;
- b) systems and channels of communication are in place to make available appropriate meteorological data on volcanic plume height or resuspended ash (in particular radar data, but also lidar, satellite remote sensing and visual observations by trained meteorological observers);
- c) 24-hour contact details are shared between the area control centre/flight information centre (ACC/FIC), meteorological watch office (MWO) and volcano observatories and relevant volcanic ash advisory centre (VAAC);
- d) information on increasing volcanic activity, volcanic eruption¹ or volcanic ash cloud in areas which could affect routes used by international flights, available from one or more observing sources, such as vulcanological, seismological, geological, meteorological, or the police/military networks and domestic aviation, is passed **immediately** to the ACC/FIC and the MWO concerned;

Note.— Where information comes from supplementary sources such as the research community, States are strongly encouraged to make arrangements consistent with the appropriate scientific protocols as advised by the International Union of Geodesy and Geophysics (IUGG).

- e) the State international NOTAM office personnel are familiar with the issuance of ASHTAMs² (or NOTAMs for volcanic ash);
- f) information, preferably supplemented by charts, concerning volcanoes in the FIRs for which the State is responsible is included in the State aeronautical information publication in accordance with Annex 15, Appendix 1, Section ENR 5.3.2; and
- g) air traffic management (ATM) contingency arrangements in respect of volcanic ash are made and promulgated, as necessary, for air routes crossing FIRs for which the State is responsible, in coordination with adjacent FIRs.

¹ The term “eruption” in Part 4 of this document refers to the start or continuation of an eruption, or its cessation.

² The ASHTAM is a special series NOTAM specifically for volcanic activity.

4.1.2 States must promulgate a requirement for pilots to make and transmit a special aircraft observation, in accordance with Annex 3, 5.5 h), in the event that pre-eruption volcanic activity or a volcanic eruption is observed or a cloud of volcanic ash is encountered or observed which may affect the safety of other aircraft operations, and to record a special air-report in accordance with Annex 3, 5.9. In addition, the International Air Transport Association (IATA), the International Federation of Air Line Pilots' Associations (IFALPA) and the International Council of Aircraft Owner and Pilot Associations (IAOPA) should bring this requirement to the attention of pilots and airline operating centres and highlight its significance for the international airways volcano watch (IAVW) and the importance of transmitting these observations in a timely manner.

Note.— Pre-eruption volcanic activity in this context means unusual and/or increasing volcanic activity which could presage a volcanic eruption.

4.1.3 It is essential that the foregoing arrangements be made in every State concerned and their efficacy continually maintained. In the case of volcanic ash, the hazard to jet transport aircraft is greatest within the first few hours following an eruption; hence speed of notification between all links in the chain of communication is critical. States may wish to consider drawing up letters of agreement between the parties involved, in particular, the civil aviation and meteorological authorities and the vulcanological agency, to record the agreed responsibilities of each party.

4.1.4 In order to assist States in enhancing the coordination between the different States' authorities/agencies involved in the IAVW, a sample letter of agreement covering the coordination and responsibilities between meteorological authorities, ATS authorities and vulcanological authorities for the provision and exchange of information relevant to volcanic ash is provided in Appendix A.

Note 1.— Consistent with the Hyogo Framework for Disaster Risk Reduction 2005-2015, States may wish to consider the above as part of an integrated suite of arrangements for other related volcanic hazards, such as ashfall on airports, populated areas and agricultural zones, shipping hazards, volcanic tsunamis, and rainfall that may induce dome collapse, lahar activity or slope failure.

Note 2.— Given the variation between States in capacity and the cross-border nature of the volcanic ash hazard, all States are encouraged to take note of arrangements in the surrounding regions, and where appropriate and invited, to assist in any reasonable manner.

4.2 ACTION TO BE TAKEN BY THE STATE VOLCANO OBSERVATORY IN THE EVENT OF A VOLCANIC ERUPTION

4.2.1 In the event of significant pre-eruption volcanic activity, a volcanic eruption occurring or a volcanic ash cloud being formed over a volcano under its vigilance, the State volcano observatory should take the following actions:

- a) immediately forward the available information to its associated ACCs, MWOs and VAACs by telephone to verbally inform them of the significant activity, and then follow up with a faxed or e-mailed volcano observatory notice for aviation (VONA). This will enable rapid notification of air traffic control (ATC) authorities about operationally critical information. VONA may also be distributed directly to interested operators in accordance with local arrangements; and
- b) maintain an up-to-date contact list of relevant agencies and conduct routine testing of the agreed dissemination pathway.

Note 1.— The key role of State volcano observatories in providing timely reports of volcanic unrest and eruptions to the aviation sector has been well established within the framework of the IAVW. Each State is required to provide information on volcanic activity to its associated ACCs, MWOs and VAACs in accordance with Annex 3.

Note 2.— The map of VAAC areas of responsibility is shown in Part 2. A list of State volcano observatories, ACCs, MWOs and FIRs is given in Part 5.

Note 3.— The VONA has been developed for State volcano observatories (or equivalent scientific agencies) to disseminate critical, operationally relevant information about volcanic activity.

Note 4.— A State may wish to further strengthen coordination among the agencies involved in dissemination and exchange of information relevant to volcanic ash, including the issuance of VONA, by drawing up a letter of agreement between the civil aviation and meteorological authorities and the volcanological agency. A sample letter of agreement is provided in Appendix A.

4.2.2 The VONA is used to report significant changes in activity of a volcano such as:

- a) escalation of precursory unrest;
- b) eruption onset;
- c) significant ash emission; and
- d) eruption cessation.

4.2.3 Along with basic volcano information (name, identifying number and location), the VONA is a brief summary of volcanic activity and observations about ash emission (or lack thereof). The VONA is intended for aviation users and not scientists.

4.2.4 The VONA includes fields for the current and previous volcano level of alert color codes for aviation, which is a green-yellow-orange-red ranking that explicitly addresses airborne ash hazards (see Table 4-4). Color codes help dispatchers, pilots and air traffic controllers to quickly ascertain the status of numerous volcanoes as they plan and execute flights over broad regions of the globe. The volcano level of alert color codes for aviation are a key component of the global standardization of information provided by volcanological agencies to aviation users.

4.2.5 A State volcano observatory should issue a VONA under the following circumstances:

- a) when volcano level of alert color code is changed; or
- b) within a color-code level when an ash-producing event or other significant change in volcanic behavior occurs.

4.2.6 Although it is recommended that State volcano observatories assign volcano level of alert color codes for aviation, if they do not, a VONA may still be issued leaving the color-code fields blank.

4.2.7 A VONA is to be disseminated to the requisite ACCs, MWOs and VAACs using the following media:

- a) e-mail;
- b) fax;
- c) telephone; or
- d) public website.

4.2.8 In accordance with ICAO's *Policies on Charges for Airports and Air Navigation Services* (Doc 9082), the costs associated with the transmission of information from State volcano observatories to their associated ACCs, MWOs and VAAC are subject to cost recovery. Guidance on cost recovery by State volcano observatories is provided in Appendix G.

4.3 ACTION TO BE TAKEN BY THE ACC IN THE EVENT OF A VOLCANIC ERUPTION

In the event of significant pre-eruption volcanic activity, a volcanic eruption occurring or a volcanic ash cloud being reported in areas which could affect routes used by international flights, the ACC/FIC responsible for the FIR concerned, on receiving information of the occurrence, should take the following actions:

- a) Pass this information **immediately** to aircraft in flight which could be affected by the volcanic ash cloud and advise ACCs in relevant adjacent FIRs. Issue an ASHTAM or a NOTAM through the State International NOTAM Office (NOF), in accordance with Annex 15, Chapter 5, giving details of the pre-eruption activity, volcanic eruption and ash cloud, including the name and geographical coordinates of the volcano, the date and time of the eruption, the flight levels and routes or portions of routes which could be affected and, as necessary, routes temporarily closed to air traffic. Include in the address list for ASHTAMs or NOTAMs concerning volcanic activity the associated MWO (see Part 2 of this document), all VAACs and the SADIS WIFS gateway at EGZZVANW.

*Note 1.— In issuing an ASHTAM or a NOTAM concerning significant pre-eruption volcanic activity, or for volcanic eruptions **not** producing ash plumes, it is recommended that the ASHTAM or NOTAM text include the following actual wording, as appropriate:*

“INCREASED VOLCANIC ACTIVITY REPORTED FOR VOLCANO (NAME AND LAT/LONG) AIRCRAFT ADVISED TO EXERCISE CAUTION UNTIL FURTHER NOTICE AND MAINTAIN WATCH FOR ASHTAM/NOTAM/ SIGMET FOR AREA”.

or

“VOLCANO (NAME AND LAT/LONG) ERUPTED (DATE/TIME UTC) BUT NO ASH PLUME REPORTED, AIRCRAFT ADVISED TO AVOID FLYING WITHIN ... KM OF THE VOLCANO UNTIL FURTHER NOTICE, MAINTAIN WATCH FOR ASHTAM/NOTAM/SIGMET FOR AREA”.

Use of such language in an ASHTAM or a NOTAM ensures that large volumes of airspace are not rendered unavailable to aircraft unnecessarily until such time as a volcanic ash plume/cloud is actually reported, or observed from satellite data.

Note 2.— In order to ensure speedy transmission of initial information to aircraft, the first ASHTAM or NOTAM issued may simply contain information that an eruption and/or ash cloud has been reported and the date/time and location. It is not necessary to await further detailed information; this may be included in subsequent ASHTAMs or NOTAMs as it becomes available.

Note 3.— Volcano level of alert colour codes for aviation should be used by some vulcanological agencies to report volcanic activity information (see 4.2.4). In States where the volcano level of alert colour codes for aviation have been introduced by the vulcanological agency, it is highly desirable to include the reported colour code in ASHTAMs or NOTAMs issued for volcanic activity.

- b) Activate contingency arrangements, including the implementation of alternative routes bypassing the area likely to be affected by the volcanic ash cloud, in coordination with ACCs and FICs responsible for adjacent FIRs.
- c) Advise the associated MWO(s) and VAAC of the volcanic eruption and/or the existence of volcanic ash cloud (including the forwarding of all special air-reports in accordance with existing provisions in Annex 11, 4.2.3) and maintain continuous coordination with the MWO to ensure consistency in the issuance and content of ASHTAMs or NOTAMs and SIGMETs.
- d) Cancel the ASHTAM or NOTAM as soon as it is considered that the volcano has reverted to its normal state and the airspace is not contaminated by volcanic ash.

4.4 ACTION TO BE TAKEN BY THE NOF IN THE EVENT OF A VOLCANIC ERUPTION

4.4.1 In the event of significant pre-eruption volcanic activity, a volcanic eruption occurring or a volcanic ash cloud being reported in areas which could affect airspace in the FIRs of the State in which the NOTAM Office (NOF) is designated, the NOF should issue an ASHTAM (or a NOTAM for volcanic activity) based on information provided by the ACC responsible for the FIR concerned. The ASHTAM or NOTAM must be cancelled, in consultation with the ACC, as soon as it is considered that the airspace is not contaminated by volcanic ash. Include in the address list for ASHTAM or NOTAM concerning volcanic activity the associated MWO (see Part 2 of this document), all VAACs and the SADIS WIFS gateway at EGZZVANW.

4.4.2 In addition to addressing the ASHTAM (or NOTAM) to other NOFs for whom the information is of direct operational significance, the NOF should include in the address list the VAAC responsible for the FIRs concerned. The States responsible for FIRs in which there are active volcanoes and the AFTN switching centres designated to receive NOTAM or ASHTAM are listed in Table 4-1.

As an example, an ASHTAM issued by the Tegucigalpa NOF would be sent to VAAC Washington as follows:

ZCZC
GG KWBCYMYX
170630 MHTGYNXX
VAMH0001 MHTG 04170630

ASHTAM

- A. CENTRAL AMERICAN FIR
- B. 04170555
- C. VOLCAN SAN CRISTOBAL.14004-02
- D. 124211N0870024W
- E. YELLOW ALERT
- F. SFC/11000FT
- G. E/SE
- H. VOR/DME MGA A317 TUKOR CNL

E) SIGNIFICANT VOLCANIC ACT
TUNGURAHUA VA MOV W.
AWY RESTRICTIONS AND ALT
RTE NOTIFIED BY ATC

3 NNNN USUAL AFTN ENDING
ENVELOPE

4.4.3 In case of a need to issue a NOTAM regarding volcanic ash deposition at an aerodrome, the following guidelines are suggested:

- a) in cases when a forecast of impending ash deposition is available, a NOTAM should be issued stating the time period when ash is expected to commence at an aerodrome;
- b) a NOTAM should be issued when ash reaches an aerodrome or begins to accumulate on the ground at an aerodrome. The NOTAM should report if the aerodrome is still open for operation;
- c) a new NOTAM should be issued every 4 hours while deposition is occurring or present in the air at the aerodrome, or more frequently as needed for occurrence of heavy ash deposition. If a friction test of runway surfaces has been made with a mu-meter, that value and the time it was made should be reported; and
- d) a final NOTAM should be issued when clean-up activities are completed and operations have resumed.

4.4.4 Since volcanic ash deposition at an aerodrome is a phenomena which could prompt the issuance of an aerodrome warning, close coordination is recommended between each NOF and the aerodrome meteorological office(s) in its area of responsibility concerning the issuance of such warnings.

4.5 ACTION TO BE TAKEN BY THE MWO IN THE EVENT OF A VOLCANIC ERUPTION

4.5.1 On receipt from the ACC/FIC of information concerning a volcanic eruption and/or the existence of a volcanic ash cloud, the MWO should take the following steps:

- a) notify the VAAC designated to provide advice on volcanic ash trajectories for the FIR for which the State is responsible that a volcanic eruption and/or ash cloud has been reported, provide available relevant details and request advisory information on the extent and trajectory of volcanic ash. In particular, special air-reports of pre-eruption volcanic activity, a volcanic eruption, volcanic ash cloud or aircraft encounter with volcanic ash received by MWOs should be transmitted to their associated VAACs, WAFC London SADIS at the address specified in Appendix B according to the region containing the area affected and WAFC Washington at KWBCYMYX;

Note 1.— The area of responsibility of the VAACs and the MWOs to which volcanic ash advisory information is to be sent are given in the ICAO regional air navigation plans and in Part 2 of this document.

Note 2.— The contact numbers that the MWOs should use to notify volcanic eruptions/volcanic ash cloud to the VAAC are given in Table 4-2.

- b) as soon as practicable, advise the associated ACC/FIC whether or not the volcanic ash cloud is identifiable from satellite images/data and, if possible,
- c) provide regular information based on advice received from the VAAC on the horizontal and vertical extent of the cloud and the trajectory of the cloud; and
- d) issue a SIGMET message for volcanic ash for a validity period of 6 hours in alphanumerical message format and, if in a position to do so, in graphical format based on the advisory information provided by the VAAC concerned. Update SIGMET information at least every 6 hours. Include in the SIGMET address all VAACs, WAFC London at the address specified in Appendix B according to the region containing the area affected, WAFC Washington at KWBCYMYX and the regional OPMET data bank(s) responsible. Maintain continuous coordination with the associated ACC/FIC to ensure consistency in the issuance and content of SIGMETs, and ASHTAMs or NOTAMs. SIGMET messages for volcanic ash issued outside the EUR Region to be transmitted to the EUR Region should be addressed in accordance to the EUR FASID Table MET 2B as follows:

Source	Responsible EUR Gateway and Address to be used	
AFI	France	LFZZMAFI
MID	Austria	LOZZMMID
ASIA	UK	EGZZMASI
CAR	UK	EGZZMCAR
NAM	UK	EGZZMNAM
NAT	UK	EGZZMNAT
PAC	UK	EGZZMPAC
SAM	UK	EGZZMSAM

Note 1.— The associated ACC/FIC should automatically be on the address list for all SIGMETs issued by the MWO.

Note 2.— In order to ensure speedy transmission of initial information to aircraft, the first SIGMET issued may simply contain information that an ash cloud has been reported and the date/time and location. It is not necessary to await further detailed information before issuing the first SIGMET. Such information may be included in subsequent SIGMETs as it becomes available.

4.5.2 In the event that the MWO becomes aware of the occurrence of pre-eruption activity, a volcanic eruption or ash cloud from any source other than its associated ACC/FIC, that information should be passed **immediately** to the associated ACC/FIC. The procedures in 4.5.1 should then be followed, as necessary.

4.5.3 In the event that a meteorological office becomes aware of the occurrence of pre-eruption activity, a volcanic eruption or ash cloud from any source, the information should be passed **immediately** to its associated MWO for onward transmission to the ACC/FIC.

4.6 ACTION TO BE TAKEN BY VAACs IN THE EVENT OF A VOLCANIC ERUPTION

4.6.1 On receipt of information from an ACC, MWO, volcano observatory or any other source³ that a volcanic eruption has been reported and/or a volcanic ash cloud has been observed in the FIR for which the MWO is responsible, the VAAC should:

- a) initiate the volcanic ash computer trajectory/dispersion model in order to provide advisory information⁴ on volcanic ash trajectories to the MWOs, ACCs and, to the extent possible, to the operators⁵ concerned;
- b) review satellite images/data of the area for the time of the event to ascertain whether a volcanic ash cloud is identifiable and, if so, its extent;
- c) prepare and issue advisory information on the extent and forecast trajectory of the volcanic ash cloud, in alphanumerical message format, as shown below, and graphical format⁶ (using the PNG format) for transmission to the MWOs, ACCs and, to the extent possible, the operators³ concerned in the VAAC area of responsibility, to WAFC London at the address specified in Appendix B according to the region containing the area affected, WAFC Washington at KWBCYMYX, and other VAACs. Advisory information on volcanic ash issued outside the EUR Region to be transmitted to the EUR Region should be addressed in accordance with EUR FASID Table MET 2B (see 4.5.1 c).

The volcanic ash advisory message should contain the following information:

message type

— VOLCANIC ASH ADVISORY

issue time, date and name of issuing VAAC

— time (UTC), day/month/year; volcanic ash advisory centre issuing advisory

name of volcano and volcano reference number

— volcano name (if known) and reference number (International Association of Volcanology and Chemistry of the Earth's Interior (IAVCEI))

the State or area in which the volcano is located and the latitude/longitude

— name of State or area (e.g. oceanic) and latitude/longitude of volcano

source(s) of information

— volcano agency (see Appendix E) or special air-report, etc.

3. When initial notification of the eruption is received from a source other than an ACC/MWO, this information should be passed **immediately** by telephone to the relevant ACC and/or MWO. Thereafter, the procedures in a) to h) should be followed.

4. On some occasions, the volcanic ash advisory could be the first information received by ACC/FIC concerning hazardous conditions which may be encountered by an aircraft in flight. The VAAC has the option to issue a volcanic ash advisory without forecast as a first piece of information to quickly warn the ACC/FIC. The first advisory will, as soon as possible, be followed by a volcanic ash advisory with complete forecast information included.

5. Advisory information from VAACs is intended to assist MWOs in the preparation of the SIGMET. However, in order to provide operators with the earliest possible advance information on volcanic ash, an AFTN address (EGLLSITV) has been provided on the SITA network to which VAACs may send their advisories for onward distribution to operators by SITA. SIGMETs for volcanic ash will, of course, be disseminated in accordance with the relevant regional air navigation plan OPMET exchange tables.

6. Volcanic ash advisories in graphical format will be included on the London and Washington satellite broadcasts. An example of the graphical format is given in the Appendix 1 to Annex 3.

details of eruption

- time (UTC), day/month/year of the eruption

details of ash cloud

- vertical extent in flight levels and horizontal extent in kilometres (nautical miles) and boundary of ash cloud in degrees and minutes

trajectory of ash cloud

- indication of direction and speed of movement of ash cloud at selected flight levels in broad descriptive terms

forecast movement of ash cloud

- forecast boundaries of ash cloud in degrees and minutes at selected flight levels for 6, 12 and 18 hours following time of issuance of advisory message

next advisory

- expected time of issuance of next advisory.

In order for the VAAC to initiate the monitoring of volcanic ash from satellite data and the forecast of volcanic ash trajectories, MWOs are expected to notify the relevant VAAC immediately on receipt of information that a volcanic eruption has occurred or volcanic ash has been observed in the FIR for which they are responsible in accordance with 4.5.1 a). In particular, any special air-reports of pre-eruption volcanic activity, a volcanic eruption or volcanic ash cloud, received by MWOs, should be transmitted without delay to the associated VAAC and to other addresses in accordance with 4.5.1 a);

- d) monitor subsequent satellite information to assist in tracking the movement of volcanic ash cloud;
- e) continue to issue updated advisory information to MWOs, ACCs and operators⁷ concerned at least at 6-hour intervals, and preferably more frequently, until such time as it is considered that the volcanic ash cloud is no longer identifiable from observations, no further reports of volcanic ash are received from the area and no further eruptions of the volcano are reported;

Note.— If volcanic ash is not identifiable from satellite data and the VAAC has reasonable doubts about the existence of volcanic ash in the atmosphere, it should be indicated in the REMARKS section of the volcanic ash advisory.

- f) maintain regular contact with other VAACs, as necessary, and the Smithsonian Institution Global Volcanism Network, in order to keep up to date on the activity status of volcanoes in the VAAC area of responsibility. In the specific case of reception of information regarding an aircraft encounter with volcanic ash (Annex 3, 5.9 refers), the information should be sent to the Smithsonian Institution Global Volcanism Network and to ICAO in order to keep up to date the database for encounters between aircraft ash clouds (Doc 9691, Appendix D refers). To that end the following e-mail addresses should be used:

gvn@volcano.si.edu
iavwopsgsec@icao.int;

- g) undertake a collaborative decision analysis and forecasting process when volcanic ash is approaching an adjacent FIR outside of a VAAC's area of responsibility;

Note.— Collaborative decision analysis and forecasting procedures are described in 4.10.

7. Advisory information from VAACs is intended to assist MWOs in the preparation of the SIGMET. However, in order to provide operators with the earliest possible advance information on volcanic ash, an AFTN address (EGLLSITV) has been provided on the SITA network to which VAACs may send their advisories for onward distribution to operators by SITA.

- h) in cases where a volcanic ash cloud is expected to approach within 300 NM of the boundary of another VAAC area of responsibility, the first (primary) VAAC will initiate the operational procedures for the coordination and may request transfer of responsibility between VAACs for volcanic ash events; and

Note 1.— Standardized operational procedures for the coordination and transfer of responsibility between VAACs for volcanic ash events are provided in Appendix C.

Note 2.— To facilitate VAACs' rapid access to volcanic ash advisories issued by other VAACs, Table 4.3 provides a listing of the WMO bulletin headers, for each product (volcanic ash in the advisory in the alphanumeric and graphical format, respectively) being used by the VAACs.

- i) in the event of long-lived volcanic ash clouds no longer being identifiable on satellite imagery, use the method of "gradual" advisory cessation by extrapolating forecast ash boundaries such that the previous 6-, 12- and 18-hour forecasts become the current analysis position in 6- and 12-hour forecasts respectively, with no ash boundary specified for the 18-hour forecast.

Note 1.— The above procedure (which is reducing the outlook period of 6 hours at each issue) should be applied unless remote sensing data or air-reports suggest there has been an error in the forecasts issued.

Note 2.— To provide rapid access to eruption source parameters data for immediate use by forecasters in ash transport and dispersion models, a preliminary spreadsheet of eruption source parameters of the world is available at <http://www.icao.int/safety/meteorology/iavwopsg>.

4.6.2 In the event of interruption of operation of one VAAC, its functions should be carried out by another VAAC or another meteorological centre, as designated by the VAAC Provider State concerned. The back-up procedures agreed by the VAACs given in Appendix D should be applied in order to provide the VAAC services as needed.

4.6.3 For those VAACs which have not yet implemented a computer volcanic ash dispersion forecast model, on receipt of information from an MWO or any other source in its area of responsibility that a volcano has erupted and/or volcanic ash cloud has been reported from the FIR for which the MWO is responsible, the VAAC should immediately contact VAAC Washington at the following 24-hour contact numbers:

Tel.: +1 (301) 683-1401

Fax: +1 (301) 683-1405

to request initiation of the United States Volcanic Ash Forecast Transport and Dispersion (VAFTAD) model and the provision of the necessary trajectory forecasts. Alternatively, VAACs may interactively run a dispersion model via the Internet at the following web site: <http://www.arl.noaa.gov/index.php>. This site also contains a number of model runs of hypothetical volcanic eruptions, generally of recently active volcanoes or those suspected to become active. If for any reason VAAC Washington is unable to respond or contact cannot be achieved, recourse should be made to VAAC London, VAAC Montreal or VAAC Toulouse at the 24-hour contact numbers given in 4.5.1 to run their dispersion models.

4.7 ACTION TO BE TAKEN BY OPERATORS IN THE EVENT OF A VOLCANIC ERUPTION

In the event of an eruption, operators should request their pilots to report, when appropriate, any observation related to a volcanic ash cloud including the absence of visible ash and all other relevant information such as observational conditions. The operator should then forward this information to the association VAAC in a timely manner.

Note.— Visible ash is defined in the Manual on Volcanic Ash, Radioactive Material and Toxic Chemical Clouds (Doc 9691).

4.8 ACTION TO BE TAKEN BY VAACs OR MWOs REGARDING VOLCANIC ASH TEST PROCEDURES

When a volcanic ash test/exercise is carried out to check the IAVW procedures, the following should be applied:

- a) the VAAC concerned should issue a volcanic ash advisory test message highlighting that the advisory refers to a test message by using “VA TEST” or “VA EXERCISE” (followed by the name of the exercise if wished) in elements 9, 11 and 17 of the volcanic ash advisory message (Annex 3, Table A2-1 refers) as part of the element description. The volcanic ash advisory message will emphasize that the message refers to a test/exercise by repeating “VA TEST” or “VA EXERCISE” as many as practicable in element 17;
- b) the MWO concerned should issue a volcanic ash SIGMET highlighting that the SIGMET refers to a test message by including “VA TEST” or “VA EXERCISE” (followed by the name of the exercise, if wished) in element “Phenomenon” of SIGMET message (Annex 3, Table A6-1 refers).

4.9 GUIDANCE TO PILOTS ON THE DETECTION OF SULPHUROUS GASES ON THE FLIGHT DECK

4.9.1 The following paragraphs provide explanatory material and guidance about recommended actions to be taken by flight crew in the event of smelling sulphur gases during flight, with the understanding that the guidance constitutes examples and does not necessarily cover all practices being applied by operators.

4.9.2 Volcanic eruptions emit various gases along with magma, including sulphur dioxide (SO₂) and hydrogen sulphide (H₂S). Volcanoes are the only sources of large quantities of sulphur gases at cruise altitudes, and both SO₂ and H₂S are detectable by smell. Thus, the smell of sulphur gases in the cockpit may indicate volcanic activity that has not yet been detected or reported and/or possible entry into an ash-bearing cloud. In some cases when sulphur gases are smelled, there may be little ash in the cloud owing to ash fallout during prior dispersion of the cloud, but flight crew do not have the means to determine directly that the cloud is non-hazardous and thus should seek to exit the cloud.

4.9.3 SO₂ is identifiable as the sharp, acrid odour of a freshly struck match. H₂S, also known as sewer gas, has the odour of rotten eggs. Sulphur gases may be detectable only for a short period of time because of “olfactory fatigue” (temporary loss of the ability to smell a particular odour).

4.9.4 Inhalation of SO₂, even at low concentrations (<5 ppm), can cause respiratory tract irritation especially in people with asthma and chronic obstructive pulmonary disease. When SO₂ gas combines with water in the atmosphere, a sulphate aerosol primarily composed of dilute sulphuric acid is formed. Flying through sulphuric acid aerosols has caused crazing of acrylic windows, fading of exterior paint and accumulation of sulphate deposits in engines. SO₂ gas is colourless, but under certain conditions of reflection and refraction of sunlight, a sulphuric acid aerosol may be a visible atmospheric feature, such as a layer of haze of variable colour (brownish, yellowish, bluish, or whitish). Ash particles likely will be present in aerosol haze but possibly in minor or trace amounts.

4.9.5 “Electrical smoke and fire” and SO₂ are two odours described as somewhat similar. After determining there are no secondary indications that would result from and indicate an electrical fire, the flight crew must establish whether the sulphur odour is transient or not. This is best achieved by flight crew donning oxygen mask(s) and breathing 100% oxygen for the period of time that results in a complete change of air within the cockpit and also allows the sense of smell to be regained. After the appropriate time period, the flight crew should remove the oxygen mask and determine if the odour is still present.

4.9.6 If the flight crew affirms the continued presence of sulphur gas, the controlling area control centre and airline operation centres must be informed as soon as practicable to request information about any relevant volcanic activity and the whereabouts of possible volcanic clouds. It is recommended that the reporting pilot use the

volcanic activity form (VAR), section 1, items 1-8, which is a special air-report. Upon landing, the flight crew should complete VAR (items 9-16) and submit it per the instruction on the VAR form to VAAC Darwin.

4.10 COLLABORATIVE DECISION ANALYSIS AND FORECASTING GUIDELINES AND PROCEDURES BETWEEN VAACs FOR VOLCANIC ASH ADVISORIES

4.10.1 Collaborative decision analysis and forecasting (CDAF) is a critical process to improve the quality of information provided in the volcanic ash advisories.

4.10.2 When volcanic ash is approaching an adjacent VAAC a CDAF process should occur between the VAACs if volcanic ash:

- a) is located within 300 NM (555 km), or other distance as agreed between the VAACs concerned, of an adjacent VAAC boundary;
- b) is forecast within 300 NM (555 km), or other distance as agreed between the VAACs concerned, of an adjacent VAAC boundary; or
- c) is forecast to cross the VAAC boundary.

4.10.3 The lead VAAC will initiate collaboration with the adjoining VAAC(s) by Internet chat or telephone.

Note.— Multilingual chat rooms will be set up and used for VAAC collaboration.

4.10.4 If the participating VAACs have collaboration tools, such as a geospatially enabled collaboration tool, the CDAF session should be conducting using these tools. The primary VAAC will propose the proper time to initiate a geo-enabled volcanic ash collaboration session. This should be done at least one hour before ash potentially impacts other VAAC area.

4.10.5 In the case of an initial notification of a volcanic ash event, it would be highly unlikely to begin the CDAF process and use of a collaborative tool any sooner than about twenty minutes after the initial notification. The steps in the CDAF process are as follows:

- a) partners/stakeholders become aware of a major⁸ volcanic ash event;
- b) initial conversations, analysis/forecasting, coordination of messaging, dissemination of text and graphical products;
- c) after the initial suite of products (e.g. advisories) has been sent, a message is sent to coordinate a collaborative session⁹;
- d) the message contains the following information:
 - 1) time of collaboration;
 - 2) platform or tool to use;

⁸ A volcanic event which either bridges or is forecast to extend across two or more VAAC boundaries.

⁹ Message will likely be an e-mail, or lead collaborator may wish to call participants first to ensure they are able to participate.

- 3) instructions (e.g. what folder to join and what the name of the session will be, such as VAAC Anchorage will join the “Alaska” folder and will join the session yyyyymmdda. The next session will be yyyyymmddb); and
- 4) telephone conference line and passcode;
- e) the lead VAAC leads the collaborative session;
- f) at the pre-determined time, all participants log into the agreed platform or tool that will support the CDAF;
- g) the users join the pre-determined folder and session name;
- h) the collaboration leader facilitates the session and shows the data relative to the eruption with annotation as needed;
- i) participants ask for control from the leader and are handed off in an orderly/organized fashion;
- j) rules of engagement include no talking over one another, proper etiquette and respect for participants on the call;
- k) the collaboration leader keeps the collaborative session moving along and ends the session when completed, keeping the workload of participants in mind;
- l) before the collaboration session ends, the collaboration leader informs the participants of the next session, if needed.

An example of a message to initiate a collaborative session is:

TO: All collaboration participants during xxxx volcano event

FROM: VAAC xxxx

SUBJECT: Collaborative Decision Analysis and Forecast Session -
yyyyymmdd hhmm UTC

A CDAF session is scheduled for yyyyymmdd hhmm UTC. The session is expected to last no longer than xx minutes.

The purpose of the session is to ensure proper situational awareness of xxxx volcano eruption and its impact. Please be ready to share information concerning xxxx eruption. Format must be in .kml and may reside on a web page or on your local drive.

Telcon information: 1-888-999-9999 passcode 12345#

Start session: join xxxx folder and yyyyymmdda session
Wait for the collaborative session leader to join for further instruction.

Thank you.

4.11 GUIDANCE FOR CONDUCTING VOLCANIC ASH EXERCISES IN ICAO REGIONS

To facilitate the conduct of volcanic ash exercises intended to develop and practice the response to volcanic activity in the various ICAO regions, Appendix F provides appropriate guidance to be followed by States and stakeholders involved.

Table 4-4. Volcano level of alert colour codes for aviation
(4.2.4 refers)

Level of alert	Status of activity of volcano
GREEN	Volcano is in normal, non-eruptive state. <i>or, after a change from a higher alert level:</i> Volcanic activity considered to have ceased, and volcano reverted to its normal, non-eruptive state.
YELLOW	Volcano is experiencing signs of elevated unrest above known background levels. <i>or, after a change from a higher alert level:</i> Volcanic activity has decreased significantly but continues to be closely monitored for possible renewed increase.
ORANGE	Volcano is exhibiting heightened unrest with increased likelihood of eruption. <i>or</i> Volcanic eruption is underway with no or minor ash emission. <i>[specify ash-plume height if possible].</i>
RED	Eruption is forecast to be imminent with significant emission of ash into the atmosphere likely. <i>or</i> Eruption is underway with significant emission of ash into the atmosphere <i>[specify ash-plume height if possible].</i>

APPENDIX A

SAMPLE LETTER OF AGREEMENT BETWEEN THE AIR TRAFFIC SERVICES, METEOROLOGICAL AUTHORITIES AND VULCANOLOGICAL AUTHORITIES

Directives for coordination between area control centres (ACCs), meteorological watch offices (MWOs) and vulcanological observatories and responsibility for the provision/exchange of information relevant to volcanic ash

Effective date:

1. OBJECTIVE

1.1 The objective of this Letter of Agreement between the [ATS authority]¹, the [meteorological authority]² and the [vulcanological authority]³ is to establish the directives for the necessary coordination between ATS units, meteorological watch offices and vulcanological observatories to ensure the provision of specific information on pre-eruption volcanic activity, volcanic eruptions and volcanic ash cloud required for civil (international and national) air navigation, in accordance with international agreements (see 1.4) and [national air navigation regulatory documents].

1.2 This Letter of Agreement provides guidelines on the responsibilities of ATS units, meteorological watch offices and vulcanological observatories in relation to the mutual exchange of information related to volcanic ash.

1.3 This Letter of Agreement is in accordance with the Standards and Recommended Practices and Procedures of ICAO, contained in Annex 3 — *Meteorological Service for International Air Navigation*, Annex 11— *Air Traffic Services*, Annex 15 — *Aeronautical Information Services* and in the *Procedures for Air Navigation Services — Air Traffic Management* (PANS-ATM, Doc 4444), as well as the provisions contained in the relevant regional air navigation plan publications and in the aeronautical information publication of [State]⁴ (AIP-[State]). This Letter of Agreement is also based on the guidance material in the *Manual on Coordination between Air Traffic Services, Aeronautical Information Services and Aeronautical Meteorological Services* (Doc 9377), the *Aeronautical Information Services Manual* (Doc 8126) and the *Handbook on the International Airways Volcano Watch* (IAVW) — *Operational Procedures and Contact List* (Doc 9766).

1.4 This Letter of Agreement includes _____⁵ appendices, regarding detailed national directives and arrangements pertaining to the use of the volcano level of alert colour code for aviation, the ASHTAM format, abbreviations, list of contact points and means of communication, stations/offices and contact numbers, etc.

2. REVISIONS

2.1 When, for special or unforeseen reasons, a significant change in the coordination between the three parties involved or the services mentioned in this Agreement becomes necessary, the respective officers-in-charge, through mutual agreement, may effect temporary changes or amendments, provided that these changes are not intended to last more than _____⁶ days.

1. Name of the ATS authority.

2. Name of the meteorological authority

3. Name of the vulcanological authority.

4. Name of the State concerned.

5. Number of appendices agreed upon by the three parties to the Letter of Agreement,

6. Figure to be agreed locally: six days appears to be a suitable period.

2.2 Permanent revisions to the Letter of Agreement may be made by the authorities who approve and sign this Agreement. This Letter of Agreement is to be reviewed annually. A complete cancellation of this Letter of Agreement may be made, in writing, by the parties to the agreement within a notice period of _____⁷ days.

3. GENERAL

3.1 In order to contribute to the efficiency and safety of international air navigation in [State] the [ATS authority], the [meteorological authority] and the [vulcanological authority] will collaborate to ensure fast and efficient coordination to minimize the impact of the presence of volcanic ash in the atmosphere.

3.2 The [MWOs]⁸[ACCs]⁹[volcanic ash advisory centres (VAACs) and selected volcano observatories] concerned shall make suitable arrangements in order to facilitate vulcanological briefings as well as inter-agency consultations and to establish reliable communications to undertake an effective coordination.

4. RESPONSIBILITIES

4.1 Responsibilities of the [meteorological authority] and the meteorological watch offices

4.1.1 General

4.1.1.1 FASID Table MET 3C identifies the selected State volcano observatories which are to notify the VAAC, MWOs and ACCs on volcanic pre-eruption, volcanic eruption and volcanic ash.

4.1.1.2 The [meteorological authority], through the [MWO] included in FASID Table MET 3C of [ANP]¹⁰, is responsible for issuing SIGMET(s) on volcanic ash, i.e. providing up-to-date information on existing and forecast volcanic ash clouds, and forecast trajectories at different flight levels based on the latest information received from vulcanological observatories or from the corresponding VAAC to those ACCs that need it in order to carry out their functions. The provision of any information related to volcanic activity and the presence of volcanic ash clouds in the atmosphere should be in accordance with the guidelines provided in the attachment to this Letter of Agreement.

4.2 Responsibilities of the [ATS authority] and area control centres (ACCs)

4.2.1 The [meteorological authority], through the [ACC] included in the FASID Table MET 3C of [ANP], is responsible to provide up-to-date information on existing volcanic ash clouds and trajectory forecasts at different flight levels to pilots and airline operation centers..This information should be based on the latest information received from:

- a) vulcanological observatories;
- b) the associated VAAC; or
- c) the associated MWO;

and passed immediately to aircraft in flight that could be affected by the volcanic ash, and to the adjacent ACCs.

7. Figure to be agreed locally: 180 days appears to be a suitable period.

4.2.2 The ACC should also issue an ASHTAM or NOTAM through the State International NOTAM Office (NOF) in accordance with Annex 15, Chapter 5, giving details of the pre-eruption activity, volcanic eruption and ash cloud, including the name and geographical coordinates of the volcano, date and time of eruption, flight levels and routes affected and, if necessary, routes to be closed to air traffic. The provision of any information related to volcanic activity and the presence of volcanic ash clouds in the atmosphere should be in accordance with the guidelines provided in the attachment to this Letter of Agreement.

4.3 Responsibility of the vulcanological authority

4.3.1 The [*vulcanological observatory*] included in FASID Table MET 3C of the [ANP] is responsible for the provision of up-to-date information on existing and forecast volcanic activity and volcanic ash clouds based on the latest information received from direct or remote observation sources to the [ACC], the [MWO] and the [VAAC] concerned. The necessary vulcanological information will be supplied in accordance with the guidelines stipulated in the attachment to this Letter of Agreement.

4.3.2 The vulcanological information provided will, as far as possible, be in the format described in step 1 of the attachment in order to facilitate easy interpretation by ATS personnel.

5. ATS UNITS, MWOs AND VULCANOLOGICAL OBSERVATORIES COORDINATION MEETINGS

Regular and/or ad hoc coordination meetings between the chiefs of the ATS units, chiefs of meteorological watch offices and chiefs of vulcanological observatories, and other interested parties, aimed at improving the services provided to aircraft, will be convened as deemed necessary to ensure the safety of air navigation in accordance with the provisions as identified in 1.3.

6. COURSES FOR METEOROLOGISTS, AIR TRAFFIC CONTROLLERS AND VULCANOLOGISTS

6.1 Courses or on-the-job training for ATS and meteorological personnel, and vulcanologists, will be organized periodically with the objective of familiarizing personnel with the activities performed by the other services.

6.2 Periods and dates for these courses will be agreed by the [ATS authority], the [meteorological authority] and the [vulcanological authority] taking into account the availability of personnel and the necessary equipment.

Attachment**GUIDELINES FOR HANDLING VOLCANIC ACTIVITY RELATIVE TO
AERONAUTICAL INFORMATION DISSEMINATION**

*(Complementary to Part 4 of the Handbook on the International Airways Volcano Watch (IAVW) —
Operational Procedures and Contact List (Doc 9766))*

STEP 1**1.1 Action to be taken by the vulcanological observatory**

1.1.1 The vulcanological observatory shall immediately provide information on significant pre-eruption volcanic activity, volcanic eruptions or the presence of volcanic ash clouds to the relevant ACCs [*list the centres*], [VAAC] and the associated MWOs [*list the offices*]. The information provided should be in accordance with the format of the volcano observatory notice for aviation (VONA) format given in Appendix E of Doc 9766.

STEP 2**2.1 Action to be taken by the ACC**

2.1.1 The ACC concerned shall immediately pass the reported information to the aircraft in flight that could be affected by the volcanic ash cloud and to the relevant ACCs in the adjacent flight information regions (FIRs).

2.1.2 On the reception of special air-reports for volcanic ash by an ACC, the following action should be taken:

- a) the information should be transmitted immediately to all aircraft concerned; and
- b) the information should be forwarded to the associated MWO.

The special air-reports for volcanic ash should be disseminated to aircraft for a period of 60 minutes after their issuance or until the issuance of a SIGMET from the associated MWO. The ACC shall verify that a SIGMET has been issued before discontinuing the transmission of the special air-report.

2.1.3 The ACC concerned shall ensure that the content of the ASHTAM is consistent with any SIGMET issued for their FIR. Further, the ACC shall ensure that any ASHTAM or NOTAM issued follows the guidance in Annex 15 — *Aeronautical Information Services*.

2.1.4 The ACC concerned shall activate contingency arrangements, including implementation of alternative routes.

2.1.5 Transmit special air-reports for volcanic ash received by voice communications and those received by data link communication to the associated MWO, and World Area Forecast Centres (WAFCs) London and Washington.

2.2 Action to be taken by the MWO

2.2.1 The MWO shall immediately forward special air-reports for volcanic ash received to its associated VAAC, WAFCs London and Washington and to the Washington and Brasilia International OPMET data banks.

2.2.2 The MWO shall ensure the reception of information from its associated VAAC on the extent and trajectory of volcanic ash.

2.2.3 The MWO shall immediately inform the ACC whether or not the volcanic ash cloud is identifiable from satellite images based on advice received from the VAAC.

2.2.4 The MWO shall issue SIGMETs in accordance with Annex 3 based on information received from the VAAC and/or vulcanological observatory and/or ACC. However, during critical conditions where an initial volcanic eruption already poses a danger to aviation, the MWO shall immediately provide to the ACC a trajectory forecast of volcanic ash based, inter alia, on the forecasts of numerical models used by the aeronautical meteorological service.

STEP 3

3.1 Action to be taken by the ACC

3.1.1 The ACC shall submit a request for the promulgation of an ASHTAM/NOTAM for volcanic ash to its associated NOTAM Office (NOF)/Aeronautical Information Service (AIS). The request shall contain the following:

- a) date and time of volcanic activity or eruption, or presence of ash clouds;
- b) name and number of the volcano (Smithsonian Tables);
- c) coordinates (latitude/longitude expressed in whole degrees) of the volcano and/or the radial and distance of the volcano from a navigational aid (NAVAID);
- d) volcano level of alert colour code for aviation indicating volcanic activity, if available (Doc 9766, Table 4-4 refers);
- e) horizontal and vertical extent of volcanic ash cloud initially based on the special air-report and subsequently based on the MWO, aeronautical meteorological service or VAAC report;
- f) forecast direction of movement of the ash cloud at selected levels based on the advice from the MWO, the aeronautical meteorological service or the VAAC report;
- g) air routes or portions of air routes and flight levels affected or expected to become affected;
- h) closure of airspace, air routes or portions of air routes, and availability of alternate routes;
- i) source of information (air-report and or vulcanological observatory and/or MWO, aeronautical meteorological service and/or VAAC) indicating whether an eruption has actually occurred or ash cloud reported, or not; and
- j) additional information.

Note.— Initially items a), b), c), and d) shall be disseminated immediately pending receipt of additional information from units concerned.

3.2 Action to be taken by the NOF/AIS

3.2.1 The NOF shall promulgate an ASHTAM/NOTAM for volcanic activity based on information provided by the ACC and in accordance with Annex 15, Appendices 3 and 6, and transmit to other NOFs for which the information is of direct operational significance.

3.2.2 The NOF shall compile a separate message to be transmitted, via AFTN, to the [associated VAAC] which shall be encapsulated within a dummy WMO abbreviated heading (Doc 9766, Table 4-1 refers). This enables

the receiving AFTN or meteorological switching centre to forward the ASHTAM/NOTAM for volcanic activity to the VAAC concerned on internal meteorological communications circuits.

Note.— Significant changes in the activity of the volcano shall be reported accordingly.

3.3 The ACC concerned shall, upon receipt of significant information relating to volcanic activity, request the NOF to revise or cancel the ASHTAM.

— — — — —

APPENDIX B

AFTN ADDRESSES TO BE USED TO PROMULGATE SPECIAL AIR-REPORTS, SIGMETS AND VOLCANIC ASH ADVISORIES TO LONDON WAFC AND SADIS VIA APPROPRIATE GATEWAY

ASIA	EGZZMASI
MID	LOZZMMID
AFI	LFZZMAFI

APPENDIX C

OPERATIONAL PROCEDURES FOR THE COORDINATION AND TRANSFER OF RESPONSIBILITY BETWEEN VAACS FOR VOLCANIC ASH EVENTS

Note — The primary VAAC is defined as the VAAC with responsibility for coordinating the production of advisories for a) an ash cloud from a volcanic eruption originating within its designated area of responsibility; or b) an ash cloud, of unknown origin, reported in its area of responsibility (including false alarms).

1. As soon as one of the VAACs learns of an eruption (for a volcano erupting within 300 NM of the VAAC's boundary) or when an ash cloud is expected to come within 300 NM of the VAAC and/or FIR boundary, an information/coordination contact will be made, normally by the primary VAAC. The possibility of a handover will be discussed, if appropriate.
2. Handover of operational responsibility shall be discussed/coordinated by the primary VAAC with adjacent affected VAACs when the ash cloud is expected to be not less than 300 NM from a VAAC and/or FIR boundary. The primary VAAC will coordinate with the neighbouring VAAC(s) to produce a coordinated product covering both areas of responsibility. The primary VAAC may produce a single product covering both areas of responsibility or both (all) VAACs may agree to produce seamless products covering their own areas of responsibility.
3. In some situations, there may be agreement that provision of information can best be served by the primary VAAC from "start to finish". In such a case, a message in the remarks section of the volcanic ash advisory would advise users of who has the responsibility (see paragraph 6). However, in situations of large or persistent ash emissions or for other reasons, adjacent responsible VAACs, upon coordination, may agree to divide the operational forecast responsibility and issue their own volcanic ash advisory (see paragraph 8). Examples of this and other situations of coordination and transfer of responsibility between VAACs are given at the end of this appendix.
4. In the case where a handover has been decided, VAACs should insert a note in their "last"/"first" volcanic ash advisory and volcanic ash advisory in graphical format that the handover will take place at that message/graphic number. The last volcanic ash advisory issued by the VAAC before handover will include the following at the end of the message (in the remarks section):

"THE RESPONSIBILITY FOR THIS ASH EVENT IS BEING TRANSFERRED TO VAAC **aaaa THE NEXT ADVISORY WILL BE ISSUED BY VAAC **aaaa** BY **xxxx** UTC UNDER HEADER **bbbb**."**

Where:

aaaa is the name of the VAAC taking over

bbbb is the bulletin header that will be used by the VAAC taking over (FVCN01 CWA0, FVXX21 KNES, FVAK22 PAWU, etc.)

xxxx is the time in UTC

Example:

"THE RESPONSIBILITY FOR THIS ASH EVENT IS BEING TRANSFERRED TO VAAC MONTREAL. THE NEXT ADVISORY WILL BE ISSUED BY VAAC MONTREAL BY 2200 UTC UNDER HEADER FVCN01 CWA0."

5. The first volcanic ash advisory issued by the VAAC that has taken over responsibility will include the following at the end of the message (in the remarks section):

“VAAC **cccc** HAS TRANSFERRED RESPONSIBILITY OF THIS EVENT TO VAAC **dddd**. THIS ADVISORY UPDATES MESSAGE **eeee**.”

Where:

cccc is the name of the VAAC issuing the advisories before the handover

dddd is the name of the VAAC that has taken over

eeee is the full bulletin header (e.g. FVAK22 PAWU 261200) of the last message issued by the VAAC issuing the advisories before the handover

Example:

“VAAC ANCHORAGE HAS TRANSFERRED RESPONSIBILITY OF THIS EVENT TO VAAC MONTREAL. THIS ADVISORY UPDATES MESSAGE FVAK22 PAWU 261200.”

6. When a VAAC is issuing messages covering a portion of another VAAC’s area of responsibility, or an ash cloud is approaching (i.e. expected within 300 NM) the area of responsibility of another VAAC, that other VAAC should:

- a) issue a volcanic ash advisory directing the user to the correct product. The following wording is suggested:

“PLEASE SEE **ffff** ISSUED BY VAAC **gggg** THAT DESCRIBES CONDITIONS OVER OR NEAR THE VAAC **hhhh** AREA OF RESPONSIBILITY.”

Where:

ffff is the full bulletin header of the message issued by the first VAAC

gggg is the name of the first VAAC

hhhh is the name of the VAAC re-broadcasting the first VAAC’s message

Example of re-broadcast message issued by VAAC Montreal:

“PLEASE SEE FVAK22 PAWU 121200 ISSUED BY VAAC ANCHORAGE THAT DESCRIBES CONDITIONS OVER OR NEAR THE VAAC MONTREAL AREA OF RESPONSIBILITY”

or

- b) send the first VAAC’s volcanic ash advisory as it is by changing only the WMO header in order to address the normal recipients within the other VAAC’s area of responsibility.

7. When two or more distinct ash clouds are present (different eruptions or one eruption for which the ash cloud has divided in two or more distinct parts), the handover only applies to the ash cloud approaching or crossing VAAC boundaries.

8. When adjacent responsible VAACs, upon coordination, have agreed to divide the operational forecast responsibility and issue their own volcanic ash advisory because of large or persistent ash emissions or for other reasons:

- a) the primary VAAC will ensure consistency at the border with adjacent VAACs;

- b) if the ash cloud is expected to move within 300 NM of the area of responsibility of a third (fourth) VAAC with no common border with the primary VAAC, the second (third) VAAC is responsible for initiating coordination; and
- c) the second (third) VAAC is also responsible to ensure consistency at the border with the third (fourth) VAAC.

9. When two or more VAACs are issuing their own volcanic ash advisories for an ash cloud that stretches across their borders (see paragraph 8), the VAACs will coordinate a common issue time for their volcanic ash advisories and will include the following at the end of their message (in the remarks section):

“PLEASE SEE ALSO **ffff** ISSUED BY VAAC **gggg** (and **f'f'f'f'** ISSUED BY VAAC **g'g'g'g'**) THAT DESCRIBE(S) CONDITIONS NEAR THE VAAC **hhhh** AREA OF RESPONSIBILITY.”

Where:

ffff, **f'f'f'f'** are the bulletin header of the message issued by neighbouring VAACs

gggg, **g'g'g'g'** are the names of the neighbouring VAACs

hhhh is the name of the VAAC issuing the volcanic ash advisory for its area of responsibility

Example of the remarks section for a message issued by VAAC Toulouse:

“PLEASE SEE ALSO FVAG01 SABM 121200 ISSUED BY VAAC BUENOS AIRES AND FVAU01 121200 ADRM ISSUED BY VAAC DARWIN THAT DESCRIBE CONDITIONS NEAR THE VAAC TOULOUSE AREA OF RESPONSIBILITY”

10. The ending of an advisory for a volcanic ash event shall be performed by the primary VAAC, upon coordination with the adjacent affected VAACs and MWOs. When more than one VAAC is issuing advisories, the ending of advisories will be coordinated between the VAACs involved.

11. VAACs should document in their handover processes as part of their quality management system as a minimum:

- a) the contact points at the neighbouring VAACs (telephone, e-mail address, websites);
- b) when a call to discuss the handover process will be initiated;
- c) from what date/time a handover will take place; and
- d) a discussion and agreement of where the volcanic ash cloud is expected to be located at handover time and beyond.

12. VAACs should establish a collaborative mechanism (such as a secure webpage) for sharing volcanic ash observational information and dispersion forecast data for evaluation of the handover.

Example 1 of coordination and transfer of responsibility between VAACs:

A single volcanic ash cloud is emitted from a volcano in VAAC A's area of responsibility and becomes “detached” from it following the end of the eruption. It drifts from the area of responsibility of VAAC A to that of VAAC B. When it is within 300 NM of the area of responsibility of VAAC B (or sooner, if one of the VAACs feels it is necessary), VAAC A contacts VAAC B to discuss coordination with respect to this volcanic ash cloud. If it is decided that the volcanic ash cloud will move either completely or partially into VAAC B's area of responsibility, the two VAACs will discuss at what moment VAAC B will become the primary VAAC and take over responsibility

for issuance of volcanic ash advisories and volcanic ash advisories in graphical format. Until this handover occurs, VAAC A remains responsible for issuing these products.

Should the volcanic ash cloud in the above scenario be large enough to require coordination with a third VAAC (VAAC C), the same procedure as described between the first two VAACs would apply between the primary VAAC (either A or B in the scenario above, depending on the timing and position of the volcanic ash cloud) and VAAC C.

Example 2 of coordination and transfer of responsibility between VAACs:

A single volcanic ash cloud is emitted from a volcano in VAAC A's area of responsibility and remains "attached" to the volcano during an extended eruption (i.e. the eruption continues). The primary VAAC (VAAC A) retains responsibility for issuing volcanic ash advisories and volcanic ash advisories in graphical format for this volcanic ash cloud, but consults the other affected VAACs and accounts for their analysis and forecast positions of the volcanic ash cloud over their area of responsibility. The primary VAAC has the responsibility for coordinating all of this information and contacting the other VAACs. However, if one of the non- primary VAACs feels the need to contact the primary VAAC, it may do so at any time.

Should the volcanic ash cloud described in the preceding paragraph be large enough that having its analysis and forecast position reflected in only one volcanic ash advisory is unwieldy, its advisories shall be issued by multiple VAACs. This would be the case where the volcanic ash cloud covers the areas of responsibility of several VAACs. Each VAAC then has the responsibility of contacting its neighbouring VAACs (as many as required by the position of the volcanic ash cloud) to coordinate the analyzed and forecast positions of the volcanic ash cloud along the boundaries between VAACs. In this case, each VAAC is considered to be the primary VAAC for its own products.

APPENDIX D

BACK-UP PROCEDURES FOR VAACS

The following guidelines on back-up procedures should be followed by VAACs:

- a) a back-up site should be established;
- b) back-up sites should have the full capability of the primary site, i.e. the ability to monitor ash dispersal, run atmospheric dispersion models, produce and distribute the volcanic ash advisory;
- c) the back-up site should be chosen as to maximize efficiency, e.g. this will normally be at an alternative 24/7 production facility with pre-existing facilities for the VAAC capability;
- d) back-up sites should maintain up-to-date contact lists as per the VAAC;
- e) in the event of the back-up site becoming operational, volcanic ash advisories issued by the back-up VAAC will contain information giving the origin of the message; and
- f) the back-up arrangements should be tested at least annually.

Editorial Note.— Most of the VAACs already have a nominated back-up site. This back-up site may be another meteorological centre in the same Contracting State or it may be another VAAC. Details about the back-up sites and their contact details together with examples will also be included in this document by the Secretariat in due course.

APPENDIX E

VOLCANO OBSERVATORY NOTICE FOR AVIATION (VONA) FORMAT

- (1) VOLCANO OBSERVATORY NOTICE FOR AVIATION — VONA
- (2) Issued: Universal (Z) date and time (YYYYMMDD/HHMMZ).
- (3) Volcano: Name and number (per Smithsonian database at <http://www.volcano.si.edu/>)
- (4) Current aviation colour code: **GREEN, YELLOW, ORANGE OR RED** in upper-case bold font
- (5) Previous aviation colour code: Lower-case font, not bold
- (6) Source: Name of volcano observatory (volcanological agency)
- (7) Notice number: Create unique number for each VONA that includes year
- (8) Volcano location: Latitude, longitude in NOTAM format (N or S deg min W or E deg min)
- (9) Area: Regional descriptor
- (10) Summit elevation: nnnnn FT (nnnn M)
- (11) Volcanic activity summary: Concise statement that describes activity at the volcano. If known, specify time of onset and duration (local and UTC) of eruptive activity. If the eruption is ongoing at the time of VONA release, indicate “eruption and ash emission is continuing”.
- (12) Volcanic cloud height: Best estimate of ash-cloud top in nnnnn FT (nnnn M) above summit or AMSL (specify which). Give source of height data (ground observer, pilot report, radar, etc.). “UNKNOWN” if no data available or “NO ASH CLOUD PRODUCED” if applicable.
- (13) Other volcanic cloud information: Brief summary of relevant cloud characteristics (colour of cloud, shape of cloud, direction of movement, etc.) Specify if cloud height is obscured or suspected to be higher than what can be observed clearly. “UNKNOWN” if no data available or “NO ASH CLOUD PRODUCED” if applicable.
- (14) Remarks: Optional. Brief comments on related topics (monitoring data, observatory actions, volcano’s previous activity, etc.)
- (15) Contacts: Names, telephone and fax numbers, e-mail addresses.
- (16) Next notice: “A new VONA will be issued if conditions change significantly or the colour code is changed.” Include URL of website where latest volcanic information is posted.
- _____

APPENDIX F

GUIDANCE FOR CONDUCTING VOLCANIC ASH EXERCISES IN ICAO REGIONS

1. OVERVIEW

1.1 Volcanic ash exercises should be conducted by ICAO on a regional basis in order to practice and develop inter-agency response to volcanic activity, in order to maintain safety, regularity and efficiency of aviation in the event of a volcanic eruption. This guidance recognizes that there is significant regional variation in the nature, frequency, observation of and response to volcanic eruptions. The frequency and scope of volcanic ash exercises is the responsibility of the ICAO region concerned. Where frequent volcanic activity results in adequate information about system performance, exercises may be omitted or constrained to infrequent, extraordinary situations or be held only to test revised procedures.

1.2 Volcanic ash exercises should be facilitated via the ICAO Regional Office concerned and support the regular assessment of system performance (in accordance with quality management principles), in particular the assessment of the safety performance which is required by ICAO safety management provisions.

1.3 Reports of the exercises or performance assessments should be reviewed by an appropriate sub-group or sub-groups within the ICAO region concerned. The focus of these reviews should be the development of improved provisions. Recommendations for improvements to global ICAO provisions, based on the regional review of the exercises, should be brought to the attention of the ICAO Planning and Implementation Regional Group (PIRG) concerned and/or to the International Airways Volcano Watch Operations Group (IAVWOPSG).

1.4 A volcanic ash exercises steering group may be established by a PIRG to coordinate all aspects of the organization and conduct of the exercises. The steering group should have representatives from, as a minimum, the volcanic ash advisory centres (VAACs) concerned, air navigation service providers (ANSPs), airspace users and regulators.

2. EXERCISES AND PERFORMANCE ASSESSMENTS

2.1 Volcanic ash exercises should be held at a frequency to be determined by the ICAO region concerned. They should be held at least every three years where the frequency of real eruptions is low and additionally as soon as practicable when significant changes to the procedures have been implemented.

2.2 Volcanic ash exercises should be designed to test volcanic activity alerting, aeronautical information service (AIS) and meteorological (MET) message routing, volcanic ash information, air traffic control procedures, air traffic flow and capacity management and aircraft operator response and the collaborative decision making (CDM) between the various actors in accordance with regional and global procedures.

2.3 Exercises can only simulate a real event, while operation of the aviation system must continue normally and be unaffected by the exercise. The planning of the exercise needs to ensure that detrimental effects on the system performance are avoided, but that nevertheless useful experience and information is generated.

2.4 A complete, system-wide exercise for volcanic ash contamination is an extremely complex undertaking since such an event involves a great number and variety of stakeholders. It might therefore be useful to constrain exercises to specific parts of the whole system, with other parts of the system being subject to testing at subsequent exercises.

3. OBJECTIVES

3.1 The exercises should be designed to:

- a) practice the conduct of volcanic activity response in accordance with the regional reference documents;
- b) verify existing information, AIS and MET message routing via AFTN addresses, relevant e-mail addresses, telephone and fax numbers, and internet addresses (URLs);
- c) maintain appropriate information and message routing between all involved agencies and organizations;
- d) provide volcanic activity response training for key personnel involved;
- e) allow regulators to assess the preparedness and operational response in terms of planning, process and procedures of operators; and
- f) provide, when appropriate, recommendations for amendment of the reference documents, in accordance with the lessons learned and conclusions contained in the final exercise report.

3.2 Exercises may also be designed to test suggested new procedures on a limited scale before regional/global implementation.

3.3 Exercise and system performance assessments should be aimed at a critical review of existing provisions and their further improvement.

4. CONCEPTS

4.1 Each exercise should involve a simulated volcanic contamination (e.g. eruption of a volcano or re-suspended ash) affecting air navigation. Simulated ash clouds may cross international boundaries, depending on the objectives of the exercise and may affect more than one VAAC area of responsibility. Exercises may utilize real-time meteorological conditions, archived data or a scenario.

4.2 Each exercise may have different objectives, which the scenario will be designed to address. For example, any or all of the activities listed below may be tested depending on the scope of the exercise:

- a) AFTN, e-mail addresses, websites, message routing and voice communications;
- b) alerting and observation of ash (e.g. use of VONA and VAR);
- c) VAAC response (e.g. volcanic ash information);
- d) ATS response (including air traffic control and AIS for NOTAM issuance);
- e) air traffic management (ATM) response;
- f) aircraft operator response (including safety risk assessment);
- g) meteorological watch office response (i.e. SIGMET); and
- h) suitability of information, its frequency, format and content.

5. PLANNING AND REPORTING

5.1 Each ICAO region should establish an appropriate structure (e.g. focal point or steering group) for the conducting of regional volcanic ash exercises and system performance assessments. For each exercise, an exercise leader should be appointed and a planning meeting held approximately three months before the exercise is due to take place.

5.2 An exercise directive should be published prior to the exercise which clearly describes the exercise scenario, participating agencies and any special instructions.

5.3 After the exercise, initial exercise reports should be prepared by all participating agencies. A debrief meeting should be held soon after the exercise to discuss the exercise reports. The exercise leader should then produce a consolidated final exercise report for consideration by the relevant ICAO group.

6. ICAO REFERENCE MATERIAL

Annex 3 — Meteorological Service for International Air Navigation

Annex 11 — Air Traffic Services

Annex 15 — Aeronautical Information Services

Procedures for Air Navigation Services — Air Traffic Management (PANS-ATM, Doc 4444)

Manual on Volcanic Ash, Radioactive material and Toxic Chemical Clouds (Doc 9691)

Global Air Navigation Plan (Doc 9750)

Global ATM Operational Concept (Doc 9854)

Flight Safety and Volcanic Ash (Doc 9974)

APPENDIX G

COST RECOVERY FOR ISSUANCE OF VONA

1. In accordance with ICAO's *Policies on Charges for Airports and Air Navigation Services* (Doc 9082), the costs of providing all aeronautical information to be charged to users of that information may be recovered:

“42. The Council considers that as a general principle, where air navigation services are provided for international use, the air navigation service providers may require the users to pay their share of the related costs...”

2. This includes information provided by State volcano observatories for international aviation. Annex 3 sets out the mandate for States to recover the costs of State volcano observatories when providing information for international aviation, specifically:

“3.6 State volcano observatories

Contracting States with active or potentially active volcanoes shall arrange that selected State volcano observatories, as designated by regional air navigation agreement, monitor these volcanoes and when observing:

- a) significant pre-eruption volcanic activity, or a cessation thereof;
- b) a volcanic eruption, or a cessation thereof; and/or
- c) volcanic ash in the atmosphere

shall send this information as quickly as practicable to their associated ACC, MWO and VAAC.

Note 1.— Pre-eruption volcanic activity in this context means unusual and/or increasing volcanic activity which could presage a volcanic eruption.

Note 2.— Doc 9766 contains guidance material about active or potentially active volcanoes.”

3. The VONA is a well-defined template for providing the information contemplated to VAACs, ACCs and MWOs.

4. Notwithstanding the mandate in Annex 3, it is up to each State concerned to determine whether cost recovery is undertaken and the specific approach used. Typically, a State's civil aviation authority would recommend to its government what approach should be taken. In this regard, Doc 9082 states:

“45. The Council observes that in determining the costs to be recovered from users:

- i. Governments may choose to recover less than full costs in recognition of local, regional or national benefits.
- ii. It is for each State to decide for itself whether, when, and at what level any air navigation services charges should be imposed, and it is recognized that States in developing regions of the world, where financing the installation and maintenance of air navigation services is difficult, are particularly justified in asking the international air carriers to contribute through user charges towards bearing a fair share of the cost of the services.”

5. For volcano observatories interested in investigating whether cost recovery is possible, there are two basic initial steps:

- a) estimate what observatory costs are legitimately aviation related; and
- b) open discussions with the State civil aviation authority and meteorological authority to discuss possible approaches and ensure that all parties act in a coordinated manner.

6. Additional explanation of these issues is provided in a 2009 document entitled *Guidance for State Volcano Observatories: the International Airways Volcano Watch*, prepared by the Australian Bureau of Meteorology, the New Zealand Civil Aviation Authority, ICAO and the World Organization of Volcano Observatories (WOVO), among others. The document is available at <http://www.wovo.org/assets/docs/gvo2009s.pdf>.

Additional advice and examples

7. The VONA delivers urgent information about activity at a specific volcano in a concise manner easily understood by non-volcanologists such as dispatchers, pilots and aviation meteorologists. Thus, when writing a VONA, avoid volcanological jargon and choose terms that will be understood by non-experts. The resulting VONA should be a simple and direct message that is focused on the specific situation at the volcano.

8. It should be noted that volcano observatory information products for aviation are not limited to VONA. In this regard, the VONA should be treated as a base-line product and volcano observatories are encouraged to provide supplementary reports with a greater level of detail, where appropriate. For example, during an eruption in Iceland the Icelandic Meteorological Office, with input from the Institute of Earth Sciences, may send frequent (several times a day) volcanic activity status reports summarizing eruption plume characteristics to VAAC London for use in its ash-dispersion model. Such status reports are not considered to be VONA. Similarly, volcano observatories in the Russian Federation and the United States issue daily reports on the status of volcanoes, and these are not VONA. The VONA is intended for significant changes in activity.

9. The U.S. Geological Survey has been issuing VONA since 2008. The VONA are posted on its volcano hazards web site at <http://volcanoes.usgs.gov/activity/vonainfo.php>. The table below shows the chronology of color-code levels assigned by the U. S. Geological Survey during the 2009 eruption of Redoubt Volcano. Over a period of 302 days, from 5 November 2008 through 28 September 2009, the Alaska Volcano Observatory changed the color code 13 times. Each color-code change was announced by a VONA.

**Chronology of color-code levels at Redoubt Volcano
November 2008 to September 2009**

Dates	Color code	Number of days at that colour
5 November 2008–24 January 2009	Yellow	57
25 January–9 March 2009	Orange	44
10–14 March 2009	Yellow	5
15–17 March 2009	Orange	3
18–20 March 2009	Yellow	3
21 March 2009	Orange	1
22–24 March 2009	Red	3
25 March 2009	Orange	1
26 March–2 April 2009	Red	8
3 April 2009	Orange	1
4–5 April 2009	Red	2
6 April–29 June 2009	Orange	83
30 June–28 Sept 2009	Yellow	91
