Making sense of safety data – an operational approach

ES² SAF Tools, 25th – 27th April 2017, ROMATSA HQ
Bucharest

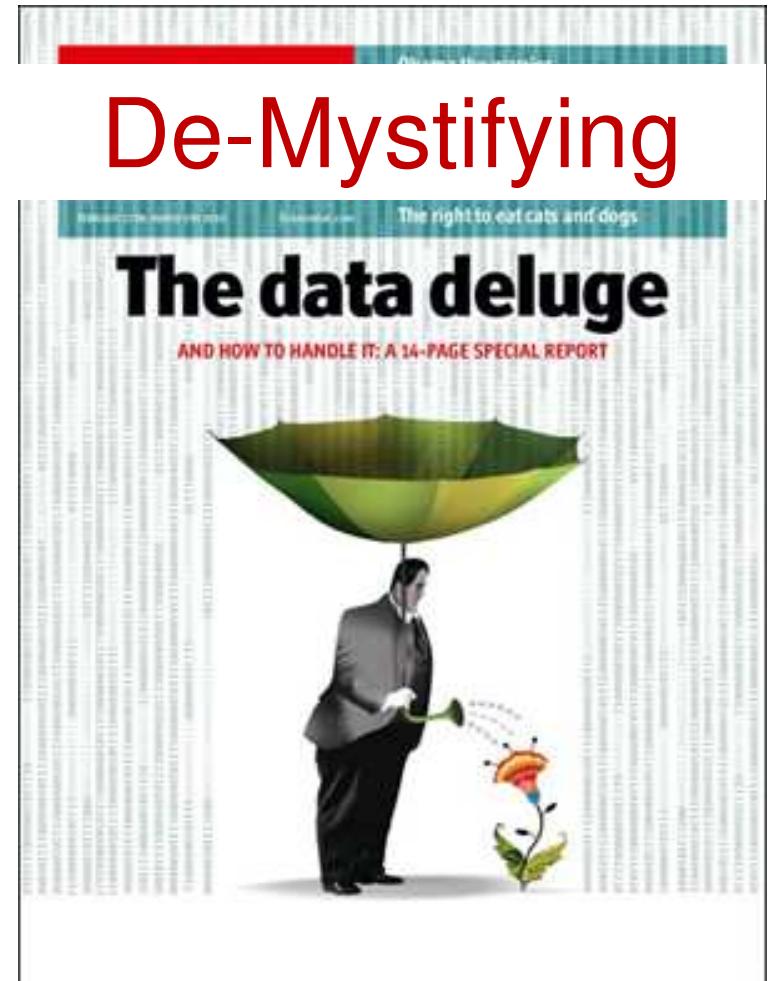

Dr. Frederic Lieutaud
ASMT Project Manager

Carlo Valbonesi
ASMT Operational Support

Digital data everywhere...

- Automatic data gathering tools
- ...manual reporting and occurrences investigations
- How to **reconcile** the two flows of data and **exploit** them to identify **systemic** safety issues?

Safety data...everywhere?

- But is ATM Safety facing a **data scarcity** problem?
 - How many SMIs are reported per month?
 - How many RWY incursions?
 - How many are the risk bearing ones?
- How to make data **bloom**?

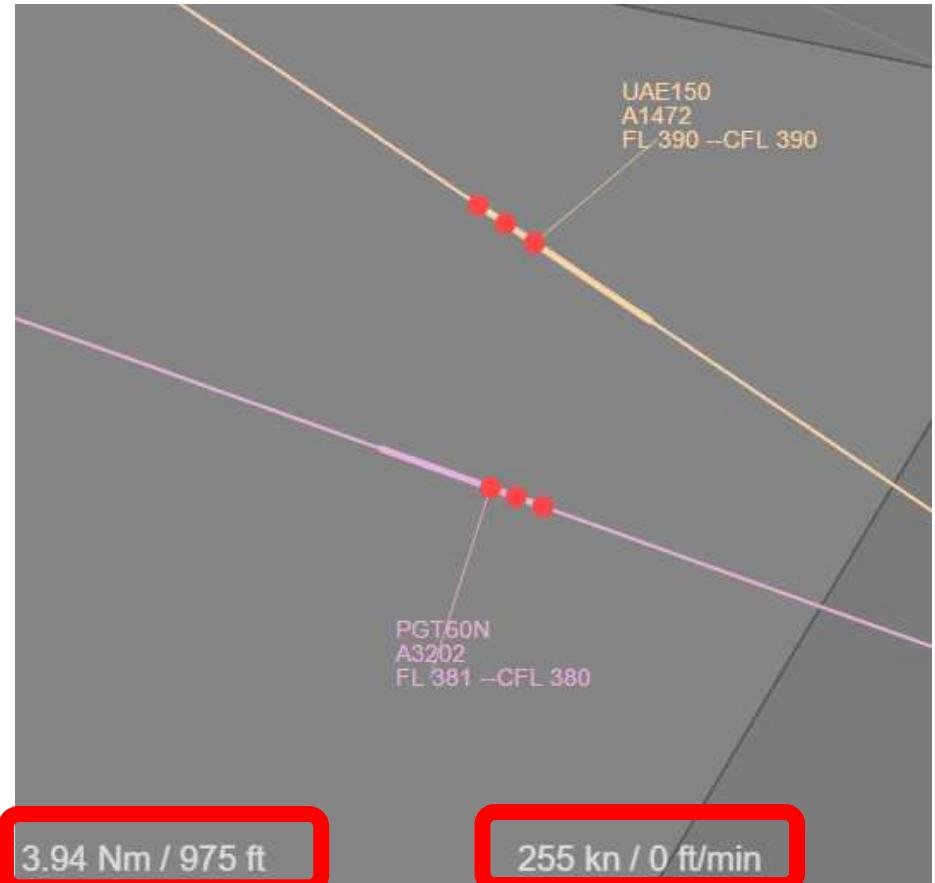

Enlarging our view on SMI

- **Extend data sets: ASMT**

- ASMT can collect data beyond what is **asked** by regulation
- ASMT collect attributes relevant for operations like:
 - Minimum achieved separation
 - Rate of closure
 - Conflict geometry;
 - ...

Network Manager

ES² SAF tools workshop – 25-27 April, ROMATSA HQ, Bucharest

Even more: quasi-SMI

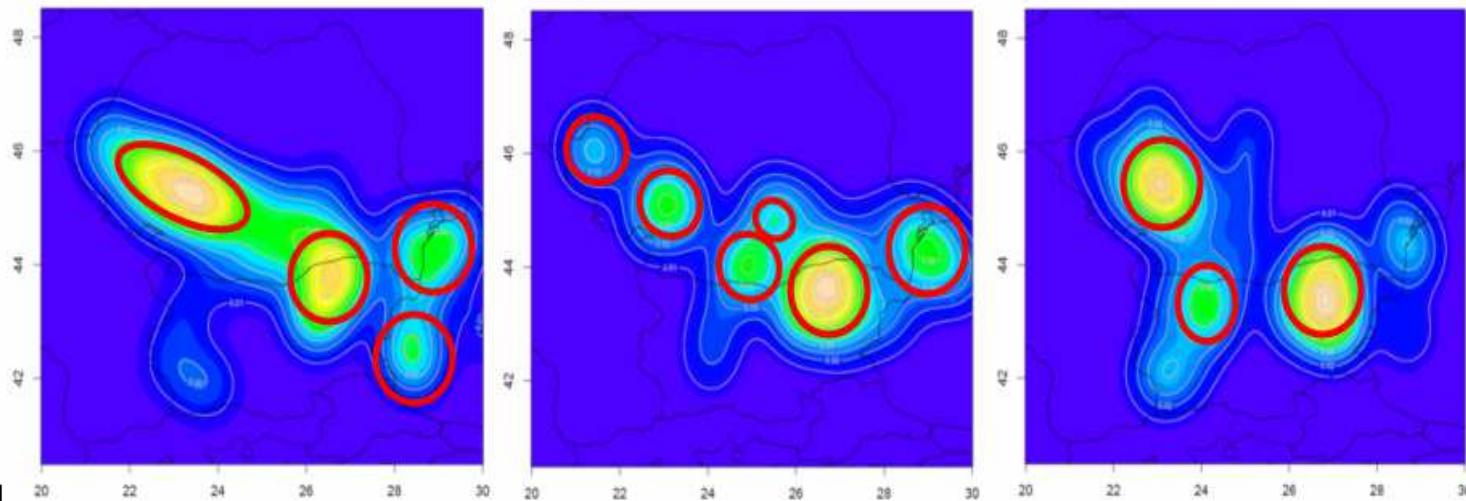

- Monitoring aircraft which are separated, but that **could infringe minima** if no modification to the situation happens:
 - They could become **actual SMI**
 - They could become **quasi-SMI**, e.g. 5,5 NM and 700 ft at CPA (range of interest can be set)

Quasi-SMI

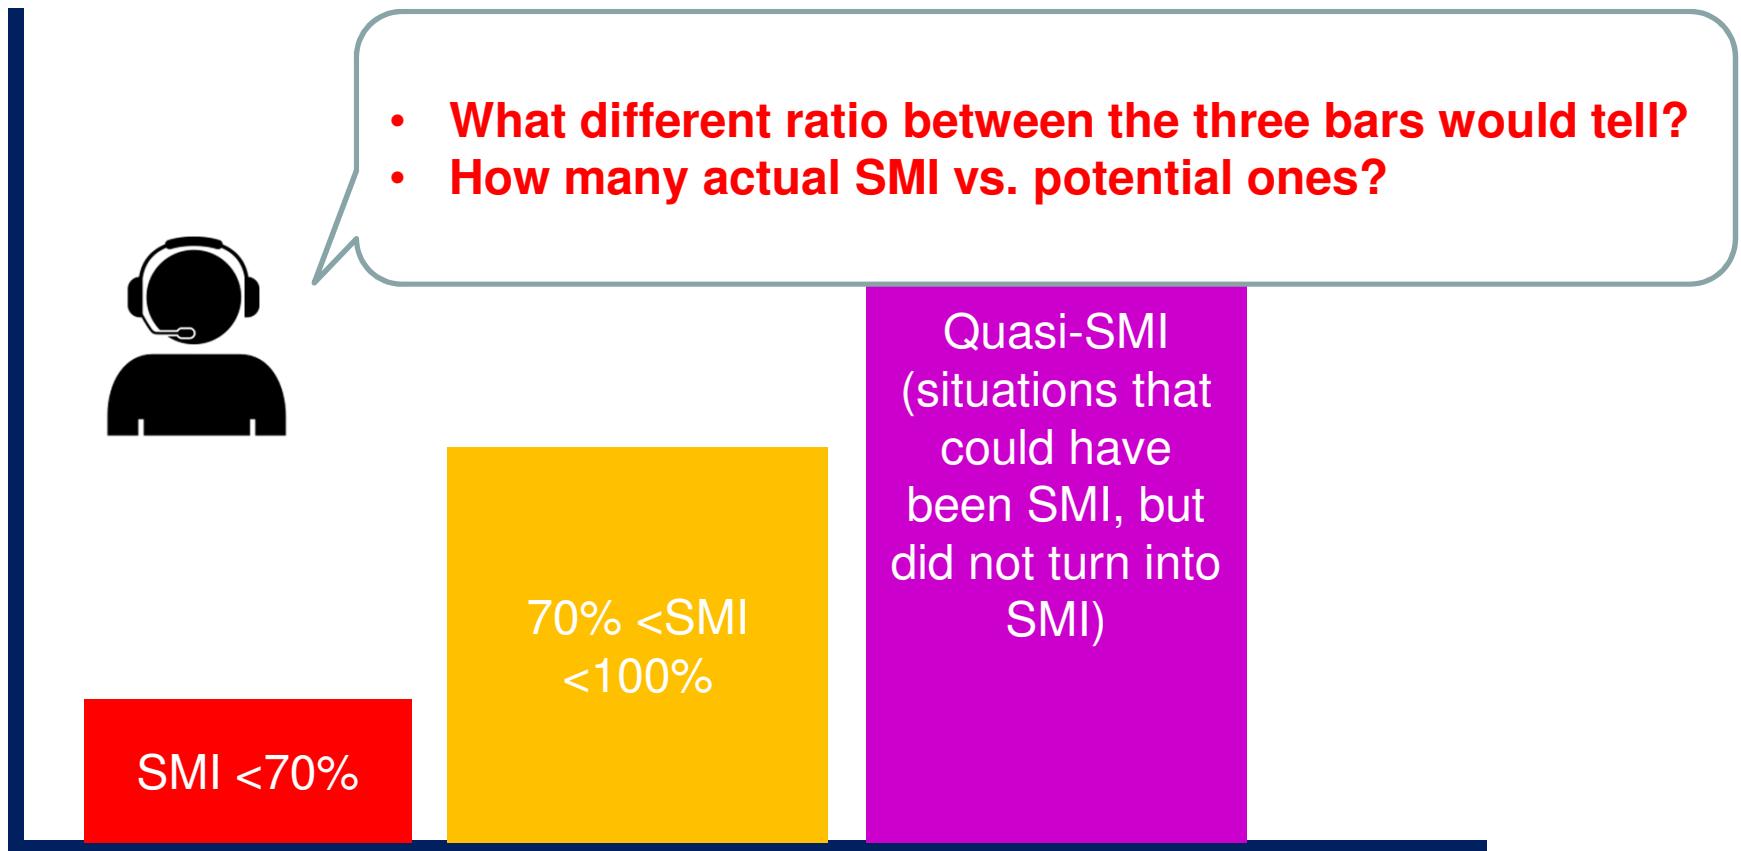

- Why **quasi-SMI**?
 - More numerous than SMI
 - **Back up subjective reports** from ATCO about conflict hotspots they feel
 - **Starting point** for investigating **systemic causes behind**

From hotspots to most frequent root causes

Drilling down into safety data

- This box will tell what **information ASMT** can provide

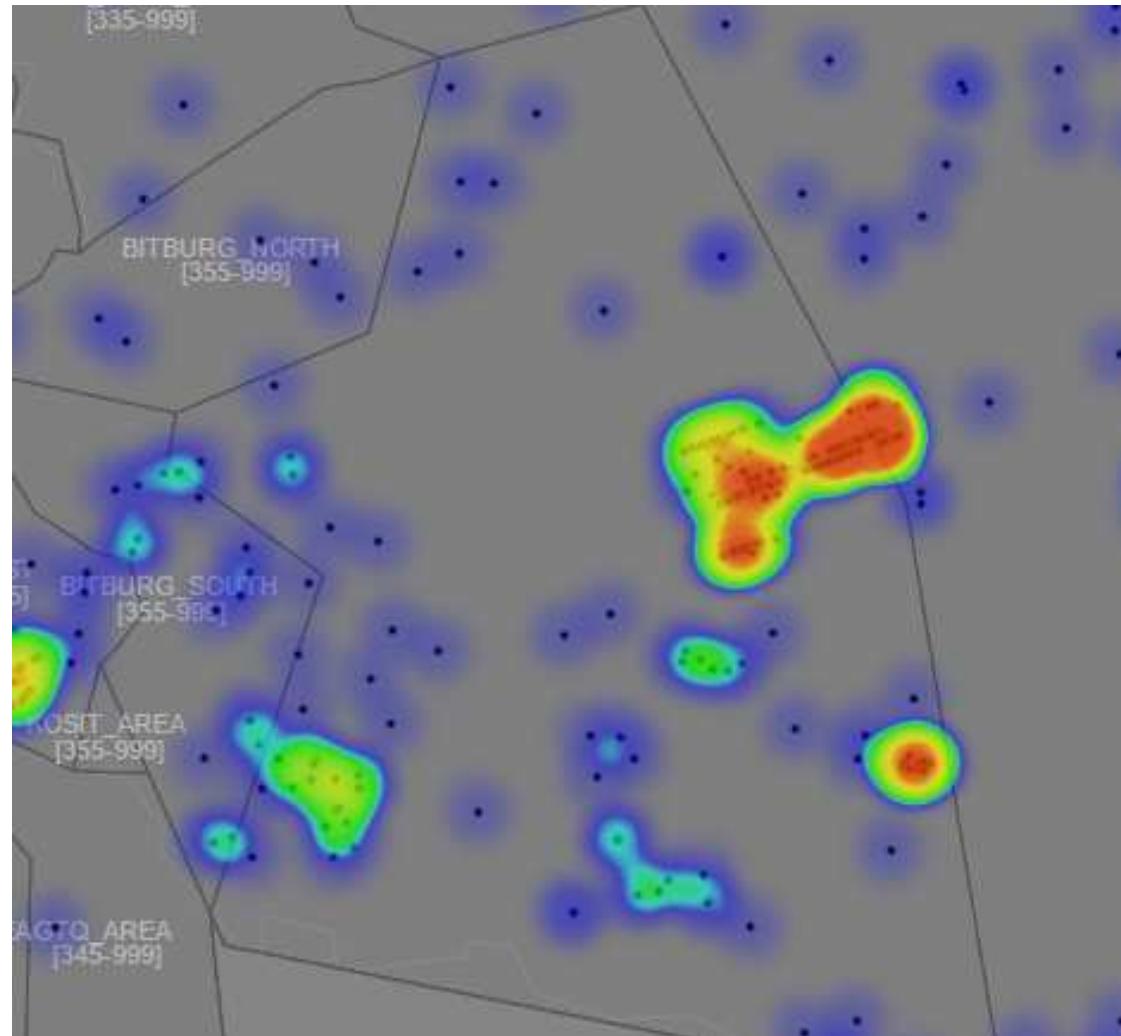

- This box will tell what **operational knowledge** can be derived

Network Manager
nominated by
the European Commission

ES² SAF tools workshop – 25-27 April, ROMATSA HQ, Bucharest

Step 1 - Hotspot by sector

Step 1 - Hotspot by sector

- **Produce hotspots for SMIs and quasi SMIs** over a week period, monthly period, annual period, in relation to a specific sector

“In which **sectors** are **safety issues concentrated?**”

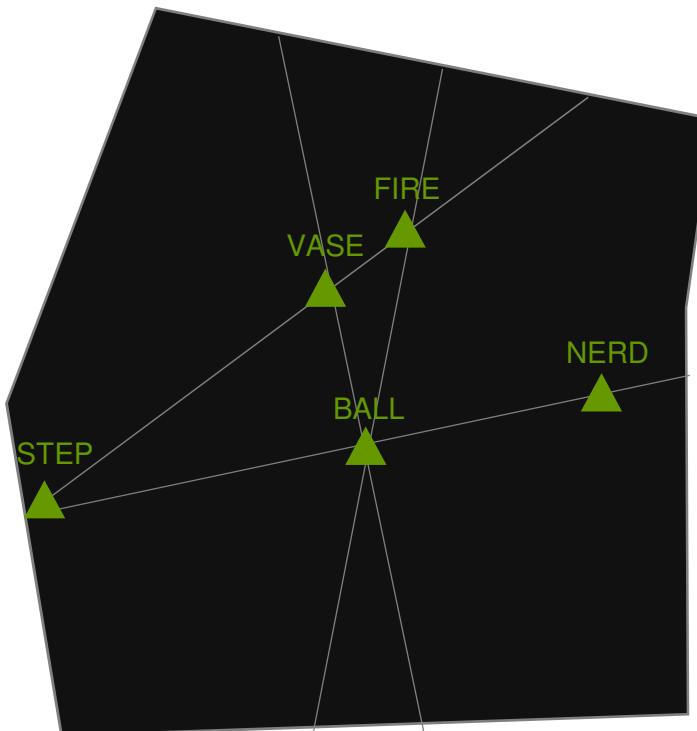

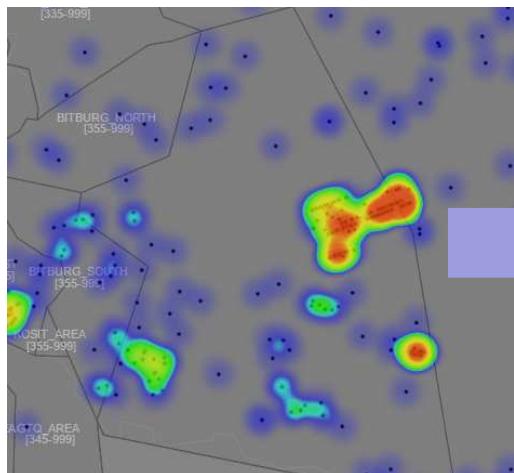

It is the starting point for our journey: what are the common latent conditions behind this concentration of events?

Network Manager
nominated by
the European Commission

ES² SAF tools workshop – 25-27 April, ROMATSA HQ, Bucharest

Step 2 – Closest fix

Network Manager
nominated by
the European Commission

ES² SAF tools workshop – 25-27 April, ROMATSA HQ, Bucharest

Step 2 – Closest fix

- By using **closest fix information**, it identifies the position of the events in relation to a reference point **well-known** to ATCOs

“Which is the navigation point where **most events** occur?”

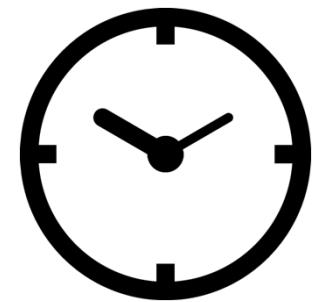

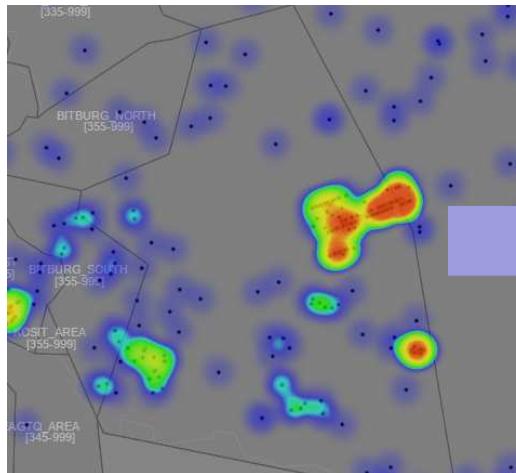

“What do I know about **traffic complexity**, **need for coordination** and **procedures** in that area?”

Network Manager
nominated by
the European Commission

ES² SAF tools workshop – 25-27 April, ROMATSA HQ, Bucharest

Step 3 – Time

Network Manager
nominated by
the European Commission

ES² SAF tools workshop – 25-27 April, ROMATSA HQ, Bucharest

Step 3 – Time

- By using **time information**, it identifies when (month, day, hour) most of the events occur

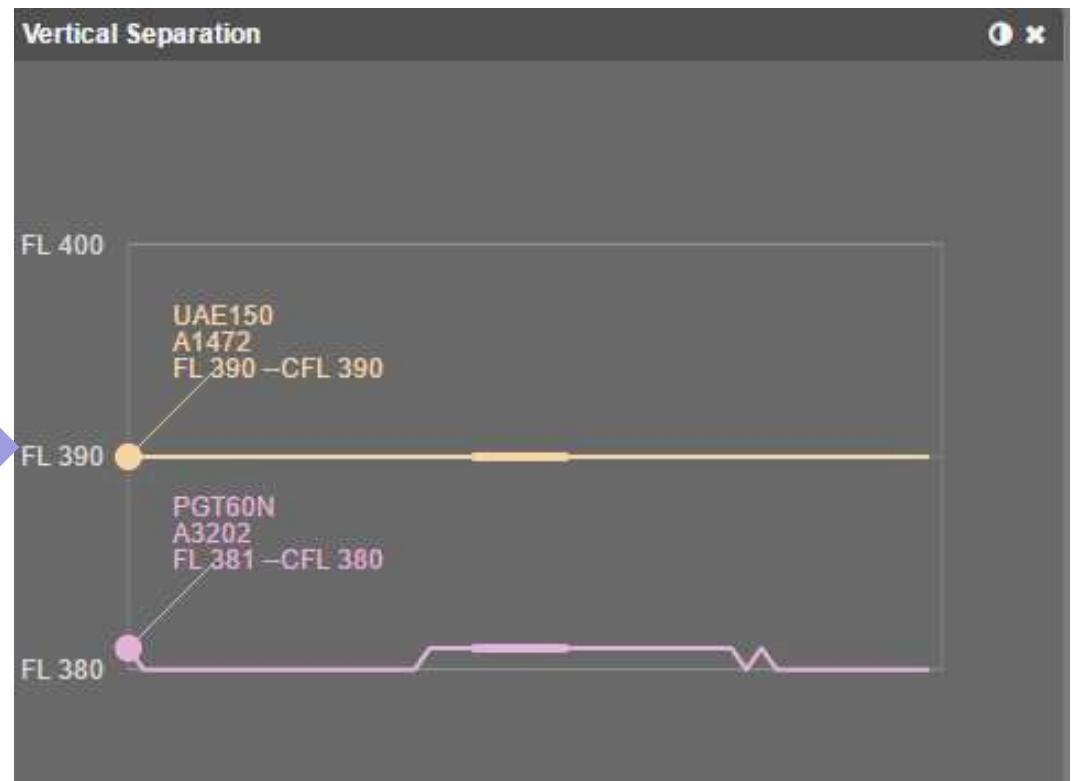

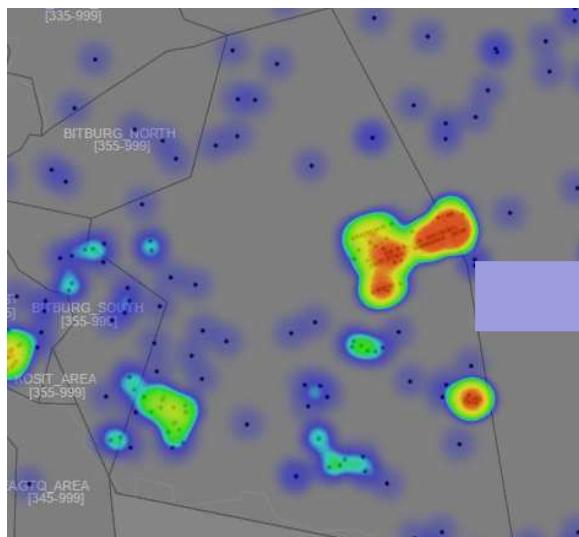

“What are the **common traffic flows** at that time of the day?”

“What **procedures** were in place on that week?”

“Was any **Ops room maintenance** taking place on at that time of the day?”

Step 4 – FL

Step 4 – FL

- By using **FL information**, it identifies the position of the events on the vertical plan

“Are events at high FL, enroute?”

«Are they almost at TMA boundary?»

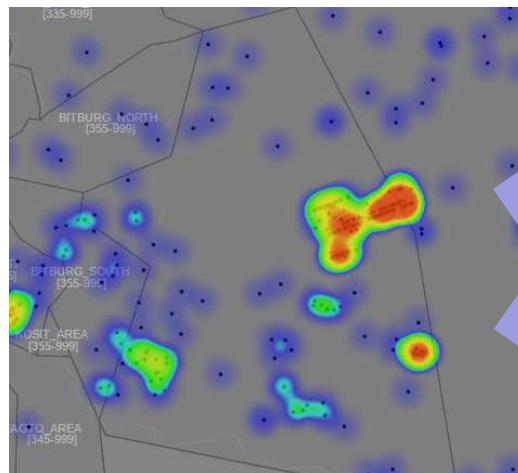

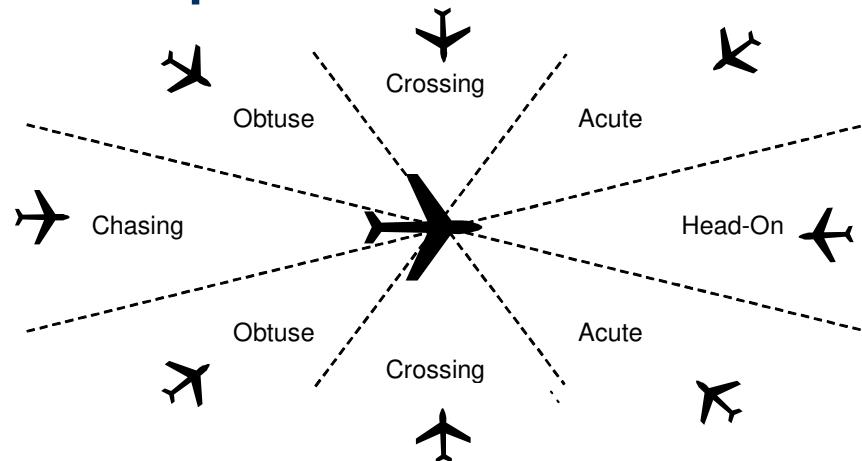

«Are they close to top of descent?»

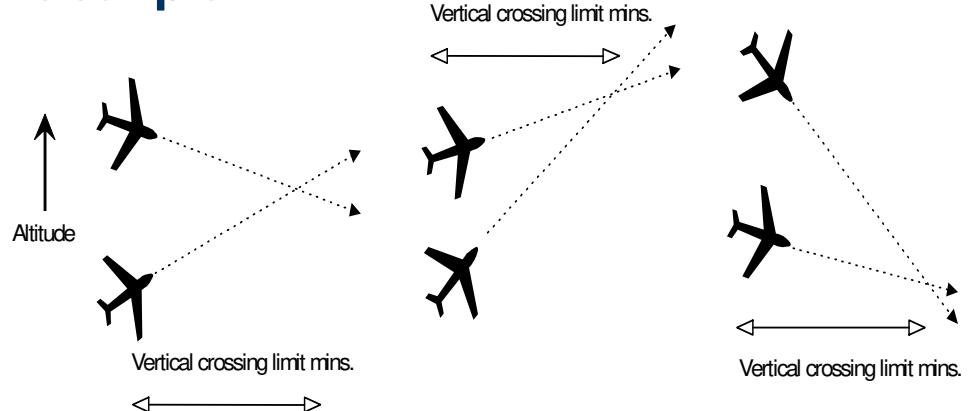

Step 5 – Geometry of the conflict

Horizontal plan

Vertical plan

Step 5 – Geometry of the conflict

- Identify what are more **frequent horizontal and vertical geometries** of the collected events

“What are the **most frequent types** of conflict?
Is that in line with my expectations?”

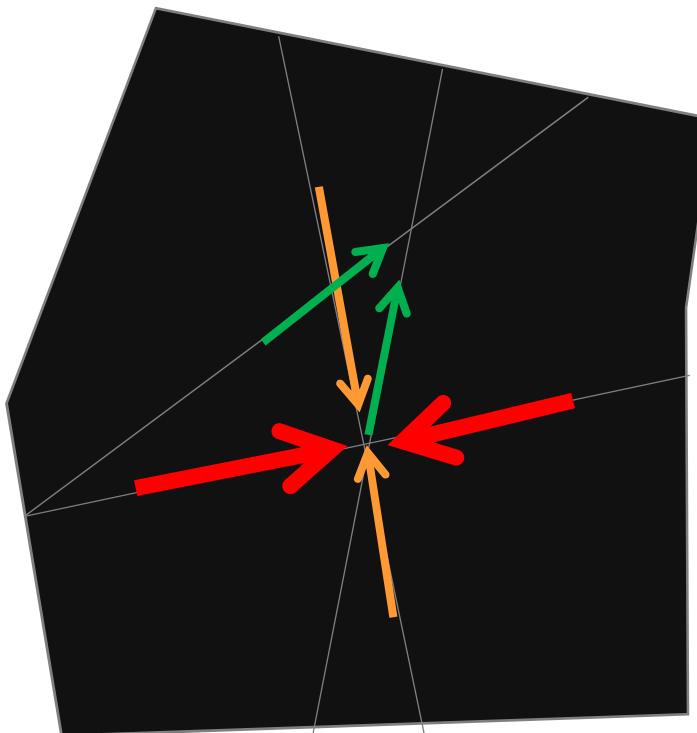

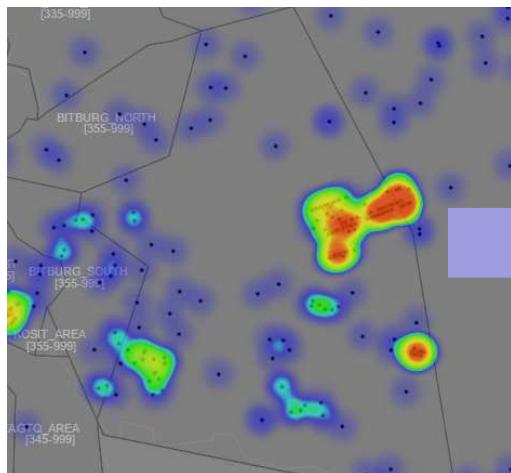

“If there is a **recurrent type** (e.g. mostly head-on, one climbing/other descending), what can I say about possible causes behind?”

Network Manager
nominated by
the European Commission

ES² SAF tools workshop – 25-27 April, ROMATSA HQ, Bucharest

Step 6 – Headings and routes

Step 6 – Headings and routes

- By using **heading information**, it identifies among the types of conflicts, which are the most frequent routes (or flows) involved

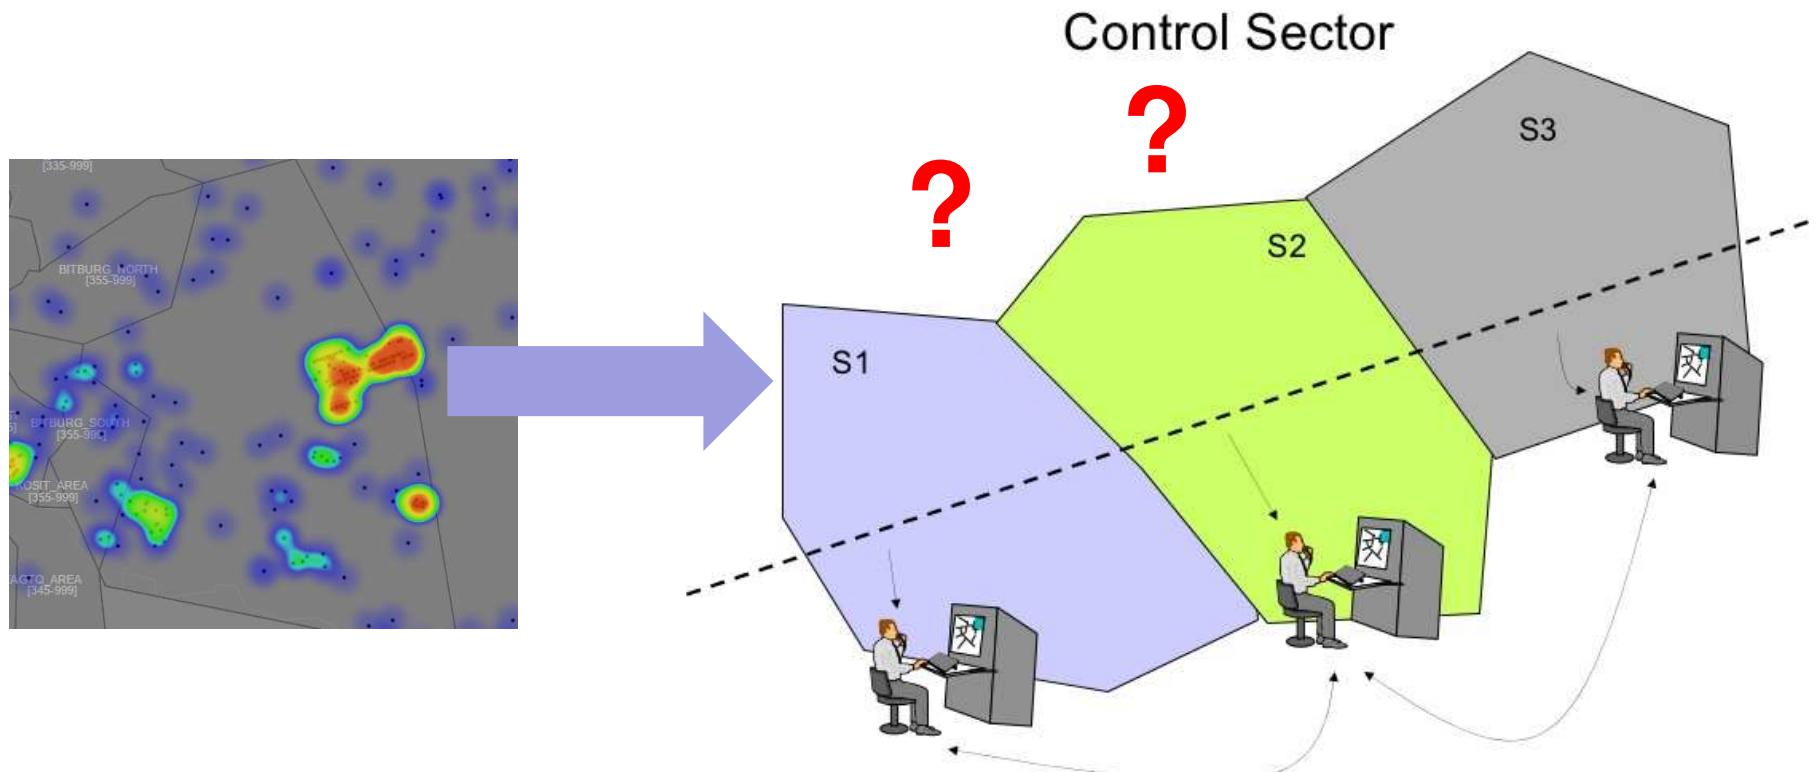

“What are the **routes / flows** which «generate» most events?”

“If there is a **recurrent route / flow involved**, what can I say about possible causes behind?”

Step 7 – Sector in control

Network Manager
nominated by
the European Commission

ES² SAF tools workshop – 25-27 April, ROMATSA HQ, Bucharest

Step 7 – Sector in control

- By using **control position ID information**, it identifies what is the sector in control of which aircraft

“What is the most frequent case? **Same sector controlling both aircraft?** Or **different sectors?**”

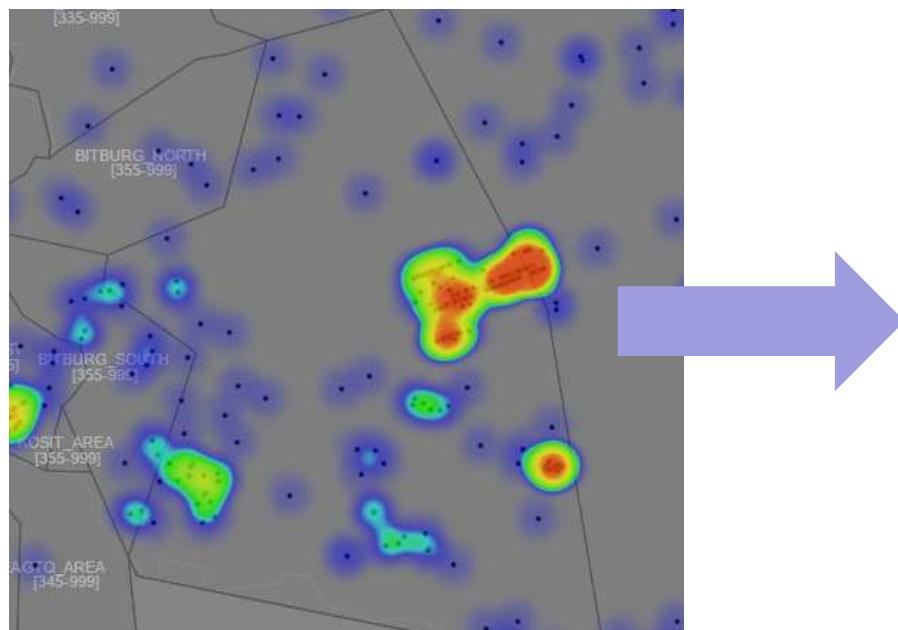

“In the second case, what does this tell me about possible **coordination issues?**”

Network Manager

Step 8 – Connecting with eTokai

- By connecting **ASMT with eTokai**, it would be possible to associate all the information provided by humans to most frequent events inside the hotspots

“What are the **most frequent contributing factors**? Procedures? Environment? What was the status of the equipment?”

Network Manager

the European Commission

ES² SAF tools workshop – 25-27 April, ROMATSA HQ, Bucharest

What you could find out?

- Most quasi-SMI and marginal SMI are in sector **UUA**
- Most of those in **UUA** are close to **BALL** fix, which is at the border of the sector
- Most of the conflicts have **one a/c steady en-route** and **one climbing, just transferred from ULA**
- Most of those at that FL band have **crossing trajectories at 90 degree angle (one a/c northbound, one a/c westbound)**
- Most of the aircraft involved are controlled by **the same sector**

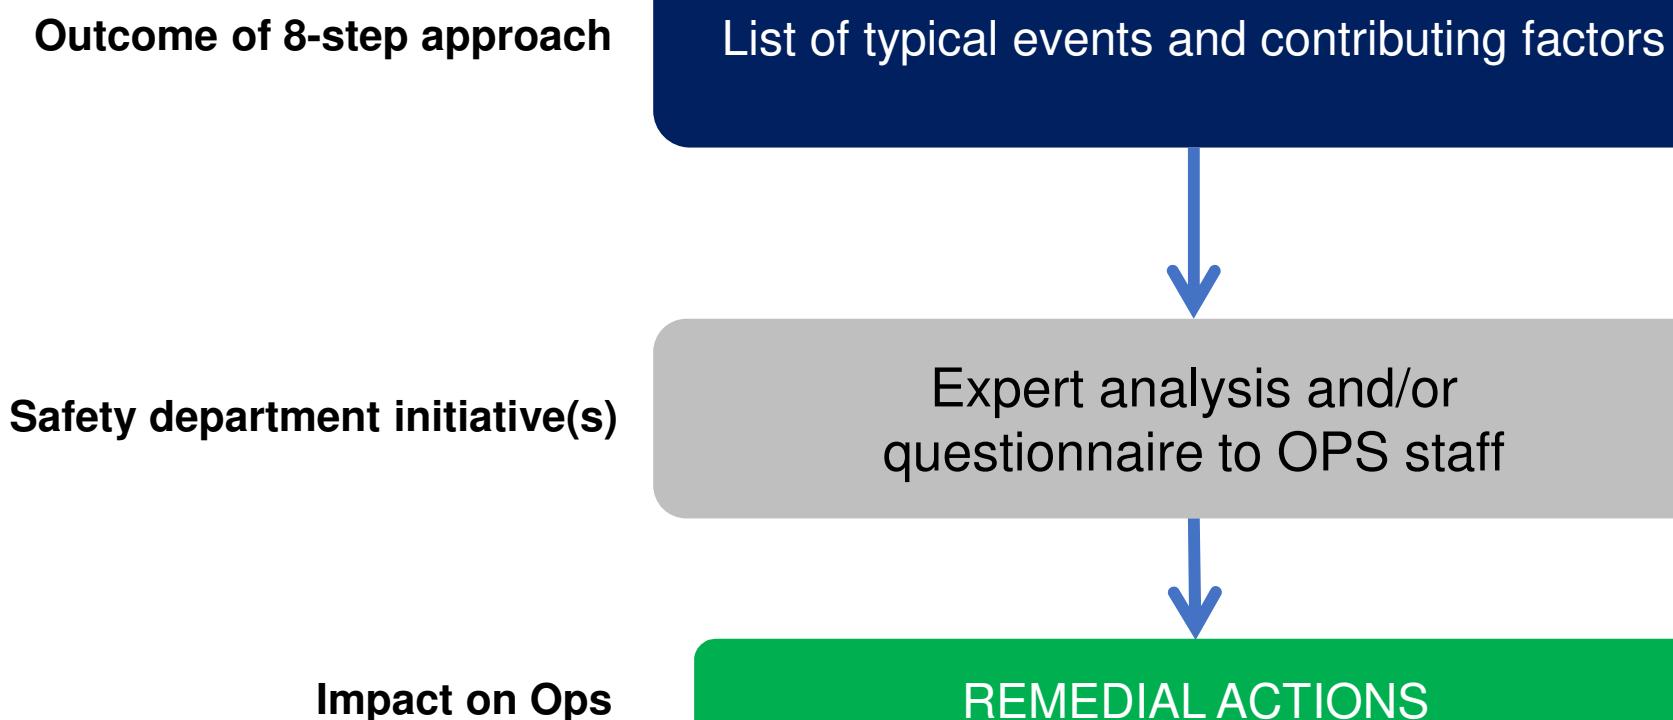

What you could find out?

- Checking in eTokai **two SMI are recorded**, in both cases **OJT was taking place**
- After inquiring with Shift supervisors and OJTIs, the safety manager could establish that **OJT on UUA often lead to quasi chaotic situations** at a certain time of the day due the numerous conflicts of this type
- **Recommendation to evaluate solutions** including e.g. limiting the climb of aircraft proceeding from ULA and further climb being granted after Way Point BALL

What next?

Network Manager
nominated by
the European Commission

Conclusions

- ASMT can **enlarge the amount of safety data** you can collect
 - All SMI, quasi-SMI and more
- We proposed an **approach for identifying and grouping events** on the base of Ops attributes
 - Ops experts are the only ones that can **make sense** of the information extracted
- The integration with eTokai helps understanding more about **underlying causes**
